EXECUTIVE SUMMARY

The illegal disposal of domestic and other potential wastes and the burning of trash piles have raised concerns in the Naples area that United States military and civilian personnel could be at risk of unacceptable health consequences from exposure to the trash and related contaminants. These contaminants may be present continuously or at intermittent times in air, water, and soil, depending on the nature of the contaminants. The principal objective of this Phase I Environmental Testing Support Assessment (ETSA) is to identify and characterize potential health impacts to United States military and civilian personnel and their families residing in the Naples area of Campania. The results of the investigation were intended to be used in a screening evaluation to determine whether exposure to ambient air, soil, tap water, and indoor air potentially pose unacceptable risks, based on United States EPA guidelines. A secondary objective of this Phase I activity was to identify technical, logistical, and procedural issues for consideration in the aspects that should be included, excluded, or revised in progressing to a larger second phase endeavor.

Volume I of this report summarizes the results collected for the Pilot Study and Phase I of this investigation. Volume I provides comparisons of the data to relevant risk-based criteria, regulatory criteria, and background concentrations, where available.

The Pilot Study included sampling at seven residences for soil and tap water, sampling at five residences for passive soil gas, and sampling of ambient air at two of the residences.

Air sampling for the Phase I ETSA was conducted over a 30-day period. Sampling began on July 7, 2008 and ended on August 8, 2008. Five samples for each contaminant group were collected over the 30-day period at each of the nine study area sampling stations (resulting in a total of 45 sampling events for each air sampling parameter over this period). Air samples were analyzed for PM-10 metals, mercury vapor, volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), aldehydes and ketones, pesticides, polychlorinated biphenyls (PCBs), and dioxins/furans. In addition, continuous ambient air monitoring of criteria pollutants (ozone, sulfur dioxide, carbon monoxide, and oxides of nitrogen) was conducted at Gricignano Support Site, through the installation and use of Continuous Air Monitoring (CAM) devices that were integrated with the meteorological monitoring system. The purpose for collecting meteorological data was to obtain information on general air conditions and wind directions to better understand and interpret the potential impacts associated with the analytical data.

Soil samples were collected from 104 of 130 residences on the economy throughout the Naples area of Campania. At 26 of the residences, soil was not available for sample collection. Additionally, 30 soil samples were collected from government-leased Parcos, six samples were collected from NAVFAC-

leased homes, and 40 soil samples were collected from government-based properties. The soil samples were analyzed for VOCs, SVOCs, dioxins/furans, pesticides, PCBs, and metals.

Tap water samples were collected concurrently with soil samples from 130 residences on the economy throughout the Naples area of Campania. Additionally, 30 tap water samples were collected from residences within the government-leased Parcos, six samples were collected from NAVFAC-leased homes, and 33 samples were collected from government-based properties. The tap water samples were analyzed for VOCs, SVOCs, dioxins/furans, pesticides, PCBs, and metals, consistent with what was analyzed for in soil samples. Tap water samples were also analyzed for radiological parameters (only gross alpha, gross beta, and total uranium), anions, cyanide, and bacteriological parameters (total coliform, fecal coliform, fecal streptococcus, and agar colony count).

Passive near-slab soil gas samples were collected from 99 residences located on the economy using a Gore module. In addition, 29 passive near-slab soil gas samples were collected from the government-leased Parcos and the six NAVFAC-leased homes. Inside each module is an adsorbent structure engineered by Gore to collect a wide variety of volatile compounds.

A total of 13 irrigation wells were sampled at Gricignano Support Site, Carney Park, Capodichino, and Parco Le Ginestre. The wells were sampled because of the potential direct exposure residents may have with the irrigation well water. The samples collected from these irrigation wells were analyzed for VOCs, SVOCs, dioxins/furans, pesticides, PCBs, and metals, consistent with what was analyzed for in soil samples. Irrigation well samples were also analyzed for radiological parameters (gross alpha, gross beta, total uranium), anions, cyanide, and bacteriological parameters (total coliform, fecal coliform, fecal streptococcus, and agar colony count).

Volume II of this report outlines the conceptual site model, uses the data presented in Volume I to conduct a screening risk evaluation, and presents risk management decisions associated with the results of the screening risk evaluation. The screening risk evaluation was conducted in accordance with U.S. EPA Risk Assessment Guidance for Superfund and the Environmental Testing Support Assessment Work Plan (Tetra Tech, 2008).

The following sections summarize the findings that are presented in Volume I.

AIR SAMPLING

The results of the Phase I air sampling indicated that concentrations of air contaminants detected across the region are typical of what is detected in United States urban environments. Many of the chemicals that were detected in air at concentrations greater than screening levels can be attributed to automobile

engine exhaust and industrial emissions. Moreover, no significant correlation could be drawn between air contaminant concentrations and noted observations of burning. However, these conclusions are based on only 30 days of air sampling. Therefore, air sampling will continue throughout the region for an additional 11 months. Air samples are being collected from nine air monitoring stations located throughout the region (**Figure 1-2**).

There were no violations of the PM-10 24-hour National Ambient Air Quality Standard (NAAQS) (150 ug/m^3) during the Phase I sampling period of July 7, 2008 to August 8, 2008. Metals, such as arsenic, cadmium, chromium, and cobalt, were detected across the region at levels greater than air RSLs. Several VOCs, such as acetaldehyde, acrolein, benzene, ethyl benzene, chlorinated hydrocarbons, and 1,2-dichloropropane were detected at concentrations greater than air RSLs. Formaldehyde was widely detected at levels greater than its air regional screening level (RSL) across the region. Two carcinogenic PAHs, benzo[a]pyrene and dibenzo[a,h]anthracene, were the only SVOCs detected at levels greater than air RSLs. Dioxins/furans were detected in air samples at concentrations greater than air RSLs in all study areas except for JFC NATO and Carney Park. Pesticides were infrequently detected and PCBs and mercury were not detected in any samples. Although there were constituents detected at concentrations greater than air RSLs, the concentrations were comparable to concentrations detected in the air in urban environments in the United States.

Based on Phase I air sampling results, as a conservative measure, Phase II air sampling has continued throughout the region, with samples being collected every nine days at the nine air sampling stations in accordance with the approved Quality Assurance Project Plan (QAPP).

SOIL SAMPLING

In surface soil samples, arsenic was detected at concentrations greater than its residential soil RSL in all samples. However, the levels that were detected across the region are most likely naturally occurring and can be attributed to the volcanic soil (which exists in the areas included in this Phase I ETSA because of proximity to Mt. Vesuvius). Carcinogenic PAHs and dioxins/furans were the only other constituents that were detected in soil at concentrations greater than residential soil RSLs. However, at most sampling locations, these concentrations are consistent with anthropogenic background levels typically found in urban environments.

A representative number of surface soil samples were collected among the nine study areas based on the likelihood of finding contamination and based on the number of U.S. personnel that were residing in those study areas. In essence, a greater number of samples were collected in areas where contamination and residents were more likely to be present. For the Phase I ETSA, three surface soil samples were collected in Study Area 4 and 19 surface soil samples were collected in Study Area 6. A statistical

analysis of the data indicated that to have sufficient confidence so as not to misrepresent an area as "clean" when it is actually "dirty," eight additional surface soil samples need to be collected in Study Area 4 and seven additional surface soil samples need to be collected in Study Area 6. The statistical analysis of the data confirmed that no additional surface soil samples are needed for the other study areas. The additional surface soil samples will be collected as part of the Phase II ETSA and will be analyzed for the same analytes as in the Phase I ETSA.

TAP WATER

Tap water data were analyzed in terms of its source: municipal water supply or private well/unknown source, including blended water consisting of municipal water and well water. When sampling was conducted, samplers searched for water meters, well heads, holding tanks or used results of chlorine tests to better identify the source of the tap water. For those locations identified as having municipal water as their water supply, the identification at best is what the landlord may portray as the municipal water supply.

- For tap water samples collected from a municipal water supply, arsenic exceeded its tap water RSL in all samples and exceeded its United States EPA Maximum Contaminant Level (MCL) in one sample in Study Area 8. For tap water samples collected from a private well or unknown source, arsenic also exceeded its tap water RSL in all samples and exceeded its MCL in 2 samples collected from Study Area 5.

- As expected in samples collected from residences connected to a municipal water supply, trihalomethanes were widely detected at levels greater than their RSLs, but were always less than its MCL. Trihalomethanes are chemicals that are byproducts of disinfecting a water supply and are typically detected in municipal water supplies. For those samples collected from residences connected to a private well or unknown source, trihalomethanes were detected less frequently and were not widely detected at levels greater than its RSL. Trihalomethane concentrations were always less than the MCL in any of the private well tap water samples.

- PCE was detected across the area in tap water samples at levels greater than its tap water RSL. Some tap water samples believed to be collected from a municipal water supply contained trace levels of PCE. PCE concentrations only exceeded its MCL in tap water samples that were collected from private wells in Study Areas 7 and 8.

- Nitrate was detected at concentrations greater than its MCL in tap water samples in Study Areas 6, 7, and 8 in samples believed to be collected from municipal water supplies and from private wells. In

Study Area 5, nitrate was detected at concentrations greater than its MCL only in tap water samples from a private well.

- Radiological activity (gross alpha and gross beta) was detected at levels greater than MCLs in Study Areas 6, 7, and 8 for tap water samples from a municipal water supply and in Study Areas 7 and 8 for tap water samples from a private well or unknown source. Speciation into specific isotopes is recommended for subsequent Phase II tap water sampling to discern whether the source of radiological activity is from naturally occurring elements or from contamination.

- Total and fecal coliform were present in municipal source tap water samples collected from Study Areas 6, 7, and 8 and private well tap water samples collected from Study Areas 5, 7, and 8. In those cases where total and fecal coliform were detected, thus exceeding MCLs, landlords were requested to clean and treat their storage tanks and plumbing systems. As a result of this treatment, total and fecal coliform were no longer detected at many of these residences.

- SVOCs (phthalates) were infrequently detected in tap water samples. Additionally, the infrequent detection of SVOCs was always at concentrations less than RSLs for the Phase I ETSA. Based on subsequent sampling results, this group of analytes was eliminated from the suite of analytes being quantified during the Phase II ETSA. A statistical analysis of the tap water SVOC data indicated that sufficient data have been collected and additional data are not needed.

- Pesticides and PCBs were never detected in any tap water sample, regardless of source. Because of the absence of pesticides and PCBs in the tap water, subsequent tap water samples collected in the Phase II ETSA will not be analyzed for pesticides and PCBs.

Tap water samples were also collected from Parcos, NAVFAC-leased homes, and government-based sites across the region. All of the samples collected from these sites were connected to a municipal water supply.

- Arsenic concentrations in all samples were greater than the tap water RSL, but were less than the MCL.

- Trihalomethanes were widely detected at concentrations greater than RSLs, but were always less than the MCL.

- PCE was detected less frequently than houses on the economy; however, it was detected at concentrations greater than its RSL, but less than its MCL, at Parco Le Ginestre, NAVFAC-leased homes, Carney Park, and the U.S. Consulate.

- SVOCs were either not detected or were detected at levels less than their RSLs at these sites.

- Pesticides and PCBs were not detected in any tap water samples from these sites.

- Nitrate and radiological activity were not detected at levels greater than MCLs in any sample.

- Total and fecal coliform were not detected in any tap water samples from these sites.

Based on these results, it is recommended that subsequent tap water samples exclude SVOCs, pesticides, and metals from the analytical program. Also, it is recommended that radiological evaluation of tap water in the Phase II ETSA should include isotope speciation.

PASSIVE SOIL GAS SAMPLING

In passive soil gas samples, VOCs were detected in all areas except for Study Area 3. Concentrations, of VOCs, estimated using default parameters associated with soil type, were less than the screening levels in passive near-slab soil gas samples collected from Study Area 4, Parco Artemide, and the NAVFAC-leased homes. These estimated concentrations were only used for screening evaluation purposes. PCE was the prevalent constituent detected at estimated concentrations greater than its screening level. Its presence suggests that PCE may be in the groundwater beneath the residences and volatilizing upward through the soil column to pose a potential vapor intrusion problem.

Soil gas data is a better indicator for determining the likelihood for vapor intrusion than groundwater data. The soil gas results that were collected using passive methods indicated that VOCs were present and suggest that there is some potential for vapor intrusion from subsurface soil gas. Passive methods provided qualitative results that better predict presence or absence of soil gas contaminants. Therefore, active sub-slab soil gas sampling is recommended in subsequent sampling in lieu of passive sampling to provide quantitative data. It is recommended that active soil gas sampling be conducted in conjunction with groundwater sampling during the Phase II ETSA.

IRRIGATION WELL SAMPLING

Water samples were collected from irrigation wells at Parco Le Ginestre, Gricignano Support Site, Capodichino, and Carney Park. Samples were collected from irrigation wells because of the incidental

contact residents or personnel could have with the water when released during sprinkling of the grounds. Irrigation well data provides an indication of the potential contamination that may be present in groundwater. Contaminant concentrations in irrigation well water were compared to tap water RSLs.

- In all irrigation well samples, arsenic was detected at concentrations greater than its RSL, but less than its MCL.

- PCE was detected at concentrations greater than its RSL at all locations except for Parco Le Ginestre. All results at all locations were less than the MCL.

- SVOCs (phthalates) were detected at concentrations greater than RSLs in the sample collected from Parco Le Ginestre.

- Nitrates were detected at concentrations greater than MCLs in samples collected from all areas.

- Radiation levels (gross alpha and gross beta) exceeded MCLs at Parco Le Ginestre and Gricignano Support Site.

- Total and fecal coliform were detected in samples collected from all locations except for Capodichino.

- Pesticides and PCBs were not detected in any samples.

No additional irrigation well sampling is recommended. The data provided sufficient information regarding the nature of contamination that may exist in irrigation well water.

1.0 INTRODUCTION

1.1 SITE BACKGROUND AND HISTORY

For more than a decade, the Naples area of Campania has experienced numerous challenges associated with trash collection, open burning of uncollected trash, and dumping of illegal waste. Historically, poor waste disposal practices have been tolerated in this region for decades. The burning of trash is a cyclic situation that peaks in late spring and summer. Responding to concerns of the base population, the Commander Navy Region Europe (CNRE) contacted the Navy and Marine Corps Public Health Center (NMCPHC) to request that a Public Health Evaluation (PHE) be performed for Navy personnel and their dependents living in the Naples area of Campania. It is anticipated that the PHE will take 18 to 24 months to complete; therefore, the Navy decided to first undertake a preliminary study, referred to as a Phase I Environmental Testing Support Assessment (ETSA), the results of which are presented in this report.

As the first step in the investigation, scientists gather environmental data to see how much contamination may be present, where it is located, and how people might come into contact with it. If the review of the environmental data shows that people have or could come into contact with hazardous substances, scientist will evaluate whether direct contact with the hazardous substances would result in harmful effects. Existing scientific information, which can include the results of medical, toxicological, and epidemiological studies and the data collected in disease registries to evaluate possible health effects that may result from exposures will also be used as part of this evaluation. The science of environmental health is still developing, and sometimes scientific information on the health effects of certain substances is not available. Scientists also need to learn what people in the area know about the contamination in the area and what concerns they may have about its impact on their health. Consequently, throughout the evaluation process, scientists actively gather information and comments from the people who live or work in the area.

As an initial part of the ETSA, a pilot study was conducted of seven residential homes during the week of April 28, 2008. The selected homes were a subset of a group of 16 volunteer homes identified by the Navy (Figure 1-1). The following samples were obtained from each of the selected pilot-study homes.

- Tap water from the kitchen faucet
- Soil samples from yard/outdoor common areas

At two of the pilot-study homes, outdoor air samples were also collected and analyzed for the following parameters:

- Particulate Matter – 10 micrometers (PM-10) metals
- Dioxins/furans
- Pesticides/polychlorinated biphenyls (PCBs)
- Semivolatile organic compounds (SVOCs)
- Volatile organic compounds (VOCs)

The purpose of the Pilot Study was to establish sampling and logistics details to improve the efficiency of the larger Phase I ETSA sampling effort outlined in the Field Sampling Plan (Tetra Tech, June 2008), that began in June 2008. Conclusions and lessons learned from the pilot program were incorporated into a revised sampling approach and schedule as appropriate.

1.2 SAMPLING OBJECTIVES

The objective of the ETSA was to identify and characterize the potential health impacts to United States military and civilian personnel and their families residing in the Naples area of Campania. The ETSA provides a screening evaluation to help determine whether exposure to ambient air, soil, tap water, and indoor air potentially poses an unacceptable risk based on United States Environmental Protection Agency (EPA) guidelines. The results of the ETSA can also be used to define where additional samples should be collected in subsequent phases of investigation and refine the analyte list. Sampling conducted for ambient air, soil, tap water, and soil gas is of sufficient quality to support the objectives of this ETSA and be of use in a possible longer-term study. Meteorological data was also collected concurrently to properly interpret air sampling analytical data collected during this investigation.

The ETSA comprised two components: (1) regional air sampling and (2) residential soil, tap water, and passive near-slab soil gas sampling. Air sampling was conducted to assess potential exposures to contaminants related to the inhalation of ambient air. Air pollutants are generally associated with major metropolitan areas but may also be attributable to the random burning of trash throughout the Naples area of Campania. Soil sampling was conducted to assess potential exposures to contaminants through incidental ingestion. The presence of soil contaminants may be attributable to the deposition of contaminants from the open burning of trash or could have resulted from illegal dumping activities. Tap water sampling was conducted to assess potential exposures to contaminants through drinking and bathing. Chemicals can migrate from soil into groundwater wells or other drinking water reservoirs. Passive near-slab soil gas sampling was conducted to assess whether contaminants in groundwater or

soil could potentially volatilize through cracks in house foundations and become available for inhalation in indoor air.

1.2.1 Objectives of Phase I Air Sampling

The objective of the air sampling plan was to measure the representative concentrations of contaminants in air, some of which may be attributable to the random burning of trash throughout the Naples area of Campania. Typically, when conducting air monitoring associated with burning activities, the development of the sampling plan includes identifying the location of the emissions source, burning schedule, and quantities and content of what is being burned. However, for this investigation, some areas are known as primary burning areas, but many of the burning locations are randomly distributed across Campania. Moreover, the frequency of the burning is random, the quantities of trash being burned are unknown, and the contents of the trash being burned are unknown. The random nature of this burning activity was considered when developing the sampling plan for air monitoring. The Phase I aspect of this air sampling plan was comprised of:

- The siting and construction of nine (9) air sampling stations across the region
- The siting, construction and operation of a meteorological tower at the Navy's Support Site located at Gricignano
- The siting, construction and operation of an air sampling station to include a continuous air monitoring (CAM) sensor to monitor criteria pollutants at the Navy's Support Site located at Gricignano
- The performance of a 30-day air sampling event comprised of a randomized sampling schedule at the nine (9) constructed stations.

1.2.1.1 Regional Air Monitoring

When the location of an emissions source is known, meteorological data are used to help predict the areas most likely to be impacted by the emissions. Because the locations of the emissions sources associated with non-routine garbage burning activities are distributed across the Naples area of Campania, air monitoring stations were distributed across the Naples area of Campania to ensure that there was adequate representation.

The areas selected for air sampling include the following government-based properties (Figure 1-2):

- Gricignano Support Site
- Capodichino
- Lago Patria Receiver Site
- Carney Park
- JFC NATO Site
- U.S. Consulate
- Parco Eva
- Parco Le Ginestre

In addition, a government-leased house in Casal di Principe was used as the location for the construction and operation of a ninth air sampling station.

These properties were selected for the following reasons:

- They provided adequate regional coverage across the Naples area of Campania.
- Many Navy personnel live in the region surrounding these locations.
- Long-term monitoring could be easily conducted.
- They ensured protection of the sampling equipment.

This regional approach precluded the need to sample air at individual residences. The specific air sampling locations at the government-based properties are illustrated on Figures 1-3 through 1-10.

The random nature of the frequency of burning and the unknown contents of the trash being burned dictated that the days that sampling occurred should be random and that the contaminant groups being sampled for on any given day should also be random. At each of the nine air sampling stations, air samples were analyzed for the following seven contaminant groups:

- Dioxins/furans
- SVOCs
- VOCs
- Pesticides and PCBs
- PM-10 metals

- Mercury vapor
- Aldehydes and ketones

Phase I ETSA air sampling was conducted over the course of 30 days. Five samples for each contaminant group were collected over the 30-day period at each of the nine sampling locations. On those days when samples were being collected for VOC analyses, samples were also collected for aldehydes and ketones. On those days when samples were collected for PM-10 metals, samples were also collected for mercury vapor. Table 1-1 provides the general schedule of the Phase I air sampling activities at the nine locations. The sample locations for air monitoring are identified on Figures 1-3 through 1-10. Table 1-2 identifies the sampling and analytical methods for the air monitoring program. Table 1-3 summarizes the analytes that comprise each compound group. Details regarding the sampling equipment, sampling procedures, and sample designations were provided in the Field Sampling Plan (Tetra Tech, June 2008). The suite of analytes selected for this investigation cover the range of potential contaminants that are expected to be present as a result of random burning in the region.

1.2.1.2 Meteorological Monitoring System

Prior to the initiation of the Phase I air sampling event, a meteorological tower was erected at the Gricignano Support Site (Figure 1-11). The meteorological monitoring system collected information on local weather conditions during all monitoring events. The meteorological data were also used in the review and analysis of air sample analytical data in support of the ETSA. This meteorological monitoring system provides meteorological and air quality data specific to this regional area of Campania.

The monitoring system consists of a 10-meter aluminum tower and is equipped with sensors to record local conditions of wind speed, wind direction, temperature, delta temperature, solar radiation, barometric pressure, and rainfall. The tower was sited on the basis of EPA guidelines and available locations at the Support Site and all sensors meet or exceed EPA performance criteria. The wind direction and wind speed sensors are mounted 10 meters above ground level at the top of the tower. Two temperature sensors are located at 10 meters and 2 meters above ground level to record differential temperature measurements for estimating atmospheric stability. Solar radiation and barometric pressure sensors are mounted 2 meters above the ground surface. Rainfall is measured in a tipping bucket precipitation gauge at ground level next to the tower. The tower is also equipped with a lightning rod and grounding system.

Additional meteorological data were collected from other meteorological towers at Capodichino and Grazzanise. Although data were available from other meteorological towers throughout Campania in Ercolano, Quarto, and San Nicola (Figure 1-12), permission must be obtained prior to using the data for commercial purposes, such as in this report. Tetra Tech is currently seeking permission to use this data.

1.2.1.3 Ambient Air Quality Sampling

In addition to the meteorological tower, an air sampling station was also constructed at the Support Site, outfitted with continuous air monitoring (CAM) devices to provide additional air quality information. The meteorological tower and the CAM devices at the Support Site air sampling station were operated during the entire Phase I air sampling event.

Analyzers were integrated with the meteorological station at the Gricignano Support Site to provide continuous ambient air monitoring of the following criteria pollutants:

- Ozone
- Sulfur dioxide
- Carbon monoxide
- Oxides of nitrogen

The gas analyzers for these compounds are housed in an 8-foot by 10-foot by 8-foot environmental shelter adjacent to the sampling location for other air contaminants (Figure 1-11). The shelter is constructed from high-quality materials, includes an air conditioning/heating system, and houses a data acquisition system (DAS). The DAS is used to acquire, store, and post-process raw data from the various gas analyzers.

1.2.2 Selection Of Properties For Phase I Soil, Soil Gas, And Tap Water Sampling

A total of 130 residences located on the economy (off-base) were selected for sampling; many of these residences were selected because they were located near known waste sites (Figure 1-2). The number of residences selected for sampling was believed to provide a representative sample for evaluating potential risk across the Naples area. The selected residences were inhabited by US military and civilian personnel who volunteered to have their residential properties included in this ETSA, predominantly comprised of personnel scheduled to depart the Naples area of Campania during the summer of 2008, as well as some properties which were vacant but identified by Navy Housing as acceptable for leasing to incoming personnel. Not all personnel who volunteered were included in this Phase I ETSA. Each volunteer completed and submitted a questionnaire (Figure 1-13) which was reviewed as an initial screen to assess certain attributes of the property valid for the sampling. Upon this initial screening activity, the tenants of selected properties were then contacted to schedule a sampling event, and these tenants were also interviewed using a standard tenant survey form (Figure 1-14) as part of the sampling to gather additional data pertinent to risk assessment matters.

As part of the process used in selecting the residential properties included in this Phase I assessment, historical information was collected and analyzed to focus on areas in the Naples area of Campania that were anticipated to have more significant waste and contaminant issues. That is, Phase I locations were "biased dirty", selecting locations where there was a coincidence of US population densities and anticipated contamination. The properties where US military and civilian personnel live were segregated into nine geographical regions identified as "Study Areas", with a focus on identifying "clusters" of residential properties near known or suspected waste sites. The total number of properties within each of these regions was factored into determining the number of properties selected for sampling within each of those areas (Figure 1-15). This analysis resulted in the sampling distribution presented in Table 1-4.

1.2.3 Objectives Of Phase I Soil And Tap Water Sampling

The objective of the soil sampling performed in Phase I was to measure the concentrations of contaminants in surface soil (0 to 6 inches below ground surface) at the selected properties, some of which may be attributable to the random burning of trash throughout the Naples area of Campania as a result of (1) airborne deposition and/or (2) illegal dumping of chemical waste. The objective of the tap water sampling performed in this Phase I activity was to measure the concentrations of contaminants in tap water, some of which may be attributable to contaminants leaching from soil to groundwater, or simply attributable to the quality of water provided by the local municipal water systems or plumbing in the household.

Surface soil samples were collected from open areas outside the residence (e.g., yard or playground) and were analyzed for VOCs, SVOCs, pesticides/PCBs, dioxins/furans, and metals. Tap water samples were collected from the kitchen faucet inside the residences and were analyzed for VOCs, SVOCs, pesticides/PCBs, dioxins/furans, metals, radiological parameters, bacteriological parameters, anions, cyanide, and field parameters (i.e., pH, specific conductance, dissolved oxygen, oxidation-reduction potential, salinity, temperature, and residual chlorine). Tap water samples were separated into two groups, based upon whether the tap water is from a municipal water supply, or from a private well or unknown source.

In addition to the 130 residences, surface soil and tap water samples were collected from the eight government-based properties where air sampling stations are located and from Parco Artemide. Irrigation wells at Gricignano Support Site, Carney Park, Capodichino, and Parco Le Ginestre were also sampled. These samples were analyzed for the same parameters as the tap water samples from residences.

A total of 166 residences were selected for analysis of soil and tap water; 130 residences were located on the economy (off-base), 30 residences were located at government-leased parcos; 6 residences were NAVFAC-leased homes. Composite surface soil samples (0 to 6 inches below ground surface) were collected from each residence. Each composite sample consisted of three to five grab samples and was analyzed for all compound groups except VOCs. A discrete soil sample (i.e., not composited) was collected from each residence and submitted for VOC analysis. Tap water samples were also collected from the same residences and were analyzed for the same parameters as the soil samples as well as radiological parameters, bacteriological parameters, anions, cyanide, and field parameters. Table 1-5 identifies the analytical methods that were used to analyze the soil and water samples. Table 1-6 summarizes the analytes that comprise each contaminant group.

A hand-held Global Positioning System (GPS) was used to determine the coordinates of all residences that were sampled and the coordinates were recorded on the soil sample log sheet. The sampling procedures and details regarding sample designation were provided in the Field Sampling Plan (Tetra Tech, June 2008).

In addition, soil and tap water samples were collected at the eight government-based properties where air sampling stations are located. These samples were analyzed for the parameters identified in Table 1-5. The number of samples being collected at these properties is summarized in Table 1-7. The tap water locations represent a source of water that is likely to be used for ingestion. Locations for soil samples at these properties are illustrated on Figures 1-16 through 1-23.

Nine irrigation wells at the Gricignano Support Site, one irrigation well at Capodichino, two irrigation wells at Carney Park, and one irrigation well at Parco Le Ginestre were also sampled. Samples were collected from irrigation wells because of the incidental contact residents or personnel could have with the water when released during sprinkling of the grounds. These water samples were analyzed for the parameters identified in Table 1-5 and are illustrated on Figures 1-16, 1-17, 1-18, and 1-22, respectively. Contaminant concentrations in irrigation well water were compared to tap water RSLs.

1.2.4 Objective of Phase I Soil Gas Sampling

Passive near-slab soil gas samples were collected at all of the homes where soil and tap water were sampled. Passive near-slab soil gas sampling was conducted to avoid invasive indoor sampling. The objective of the passive near-slab soil gas sampling was to measure the concentrations in soil gas of contaminants that may be attributable to the presence of chemicals such as VOCs, pesticides, or PAHs in soil or groundwater. The presence of these contaminants in soil and groundwater potentially may be from improper disposal of these chemicals or frequent use of pesticides in rural areas.

The purpose of this sampling was to determine if contaminants present in soil or groundwater are volatilizing at rates that result in soil gas concentrations that can potentially migrate to the surface and infiltrate through cracks in a home's foundation. The passive near-slab soil gas samples were analyzed for contaminants using the GORE™ Module, a patented, passive diffusion sorbent-based sampler, that collects samples for VOCs, SVOCs, and pesticides. The adsorbents have an affinity for a broad range of compounds. The sampling procedure for soil gas sampling using the Gore™ Module and details regarding sample designation are provided in the Field Sampling Plan (Tetra Tech, June 2008).

1.3 QUALITY CONTROL

Quality control (QC) samples including field duplicates and trip blanks were collected or generated during all environmental sampling activities. Field duplicates were obtained during a single act of sampling and were used to assess the overall precision of the sampling and analysis program. Duplicate samples were collected at 5 percent of the sampling locations for each medium.

Sufficient volumes of soil and water were collected to provide samples for matrix spike (MS) and matrix spike duplicate (MSD) analyses. The MS is an investigative sample analyzed to provide information about the effect of the sample matrix on the digestion and measurement methodology. MS/MSD pairs were collected at a rate of 5 percent of samples (1 per 20 samples).

Trip blanks were used to assess the potential for contamination of VOC samples resulting from contaminant migration into sample containers during sample shipment and storage. Trip blanks are prepared by the laboratory prior to the sampling event, shipped to the site with the sample containers, and kept with the investigative samples throughout the sample event. They are then packaged for shipment with other VOC samples and sent for analysis. One trip blank was included in each sample shipping container that contained VOCs.

Approximately twenty percent of all laboratory samples collected for NSA Naples were validated in accordance with EPA guidelines and analytical method requirements. The remaining eighty percent of the samples were not fully validated, but underwent a verification review step that checked for agreement between hardcopy results and the electronic data provided by the laboratory. Data validation is an objective systematic process in which analytical data are reviewed to ascertain the validity of the reported results and to alert the data user to the possible limitation of these results. The process of data validation is designed to ensure compliance with analytical methodologies and procedures and to provide data that is technically defensible to the end user.

Data validation procedures were conducted in accordance with one or more of the following:

- U.S. EPA Contract Laboratory Program National Functional Guidelines for Organic and Inorganic Data Review (EPA-540/R-99-008, & EPA-540/R-04-004)

- Analytical method procedures (Test Methods for Evaluating Solid Waste Physical/Chemical Methods SW-846, Third Edition)

- Department of Defense Quality Systems Manual (QSM) for Environmental Laboratories, Final Version 3, January 2006.

SGS Laboratories was selected to provide analytical support because it was the only laboratory within Europe that could provide analytical results using US EPA methodologies and produce a comprehensive Level IV data validation deliverable. The Level IV data validation deliverable includes all the raw data and quality control parameters, such as calibration information, blank summaries, surrogate recoveries, and internal standards information. Additionally, it was a project requirement that analytical results be provided without local or regional influences. Therefore, only SGS Laboratories, with laboratory facilities outside of Italy, could meet this requirement. The following SGS laboratories were used:

- SGS in Herten, Germany, was used for all routine chemical analyses of water, soil, and air
- SGS in Rouen, France, was used for all radiological analyses of water
- SGS in Antwerpen, Belgium was used for dioxin analyses of water, soil, and air.
- SGS techicians, from Germany were used at the U.S. Naples Hospital Naples to perform bacteriological analyses because the eight-hour holding time requirement until analysis prevented shipment of samples without exceeding the holding time.

Fixed-based results for the target analytes are being used in the quantitative screening risk evaluation. The data were validated and indicated that the quality of the data meets the objective of supporting a screening risk evaluation. For statistical comparisons and mathematical manipulations, non-detected values (U-qualified data) were represented by a concentration equal to one-half the sample-specific reporting limit. Duplicate results (original and duplicate) were not averaged to represent the range of reporting limits; however, the average of the original and duplicate samples was used to represent the concentration at a specific sampling location. Analytes qualifed as estimated (J-qualifed data), indicate that the analyte is detected, but its concentration is reported at a concentration less than the quantitation limit. These values were used as reported in the screening risk evaluation, statistical comparisons, and mathematical manipulations. Data regarded as unreliable (R-qualified) were not used in the screening risk evaluation.

1.4 SAMPLE TRACKING, CHAIN-OF-CUSTODY PROCEDURES, AND RECORD KEEPING

Samples were recorded by the Field Operations Leader (FOL) on chain-of-custody (COC) forms. Each COC form included the identification numbers of the samples collected on a given day, time(s) of collection, names of the samplers, and others who subsequently had custody of the samples. The COC form also included the chemical analyses requested. Stringent COC procedures were followed to document sample possession.

In addition to COC forms, certain standard forms were completed for each sample. These included sample log sheets and daily records of investigation reports. A bound/weatherproof notebook was maintained by the FOL. Information related to the sampling or field activities was recorded in the field notebooks. This information included but was not limited to, sampling time, weather conditions, observations of apparent improper waste disposal/burning events, or unusual events. The relevant field records including field notebooks, COC forms, sample log sheets, and daily logs are included in the project file.

1.5 REPORT ORGANIZATION

Volume I of this report summarizes the results collected for the Pilot Study and Phase I of this investigation. Volume I provides comparisons of the data to relevant risk-based criteria, regulatory criteria, and background concentrations, where available. Volume II of this report uses the data presented in Volume I to conduct a screening risk evaluation. The screening risk evaluation was conducted in accordance with U.S. EPA Risk Assessment Guidance for Superfund and the Naples, Italy, Environmental Testing Support Assessment Work Plan (Tetra Tech, 2008).

This document comprises Volume I. Section 1.0 is this introduction. Section 2.0 provides a summary of the pilot study results. Section 3.0 provides a summary of the air sampling results from the nine air monitoring locations, a comparison of the data to relevant risk-based and regulatory criteria, and a summary of the meteorological data. Section 4.0 provides a summary of the soil sampling results from the residences in the various study areas and the government-based properties and a comparison of the data to relevant risk-based criteria and background concentrations. Section 5.0 provides a summary of the tap water sampling results from the residences in the various study areas and the government-based properties and a summary of data collected from selected private wells and irrigation wells. A comparison of the data to relevant risk-based criteria, regulatory criteria and background concentrations is provided. Section 6.0 provides a summary of the soil gas sampling results from the residences and a comparison of the data to relevant risk-based criteria. Section 7.0 provides a summary of the irrigation well results and a

comparison of the data to relevant risk-based criteria and background concentrations. Section 8.0 is an overall summary of the results and recommendations for subsequent investigations.

NAPLES PUBLIC HEALTH EVALUATION
RESIDENTIAL SAMPLING QUESTIONNAIRE

Please return this completed questionnaire via the enclosed envelope or deposit in one of the following Residential Sampling Questionnaire Drop Box Sites: NEX entrances (Gricignano and Capodichino), Navy Lodge Gricignano, Capodichino Post Office, and JFC Bagnoli (Air Force, Army and Navy Support Elements) – look for the green boxes with the Naples Community Health Awareness logo.

Sponsor Name _____ Date _____

Sponsor's Command _____ Supervisor's Name/Phone _____

FPO Mailing Address _____

Home Address (as shown on lease) _____

Parco Name/City/Commune _____

Mobile Phone _____ Home Phone _____ Work Phone (Commercial) _____

1. When is the best time to call you? _____ AM or PM ☐Work ☐Home ☐Mobile (please check one)
2. Total number of occupants at your home: _____
   Number of children: _____ Ages:_____
3. How long have you lived at this residence? _____ (months)
4. How long do you anticipate remaining at this residence? _____ (months)
5. Type of Home/Structure (please check only one):
   ☐ Single Family Home ☐ Duplex ☐ Apartment ☐ Townhouse
   ☐ Other: Please specify _____
6. If you live in an apartment building, what floor(s) do you live on?
   ☐ Ground ☐ First ☐ Second ☐ Third ☐ Fourth ☐ Fifth ☐ Other: _____
7. What is the source of your tap water (check all that apply)?
   ☐ Public Water Supply ☐ Private Well ☐ Combination ☐ Don't Know
   ☐ Other: Please specify _____

Enclosure (4)

8. What do you use your tap water for? (check all that apply)
   ☐ Drinking ☐ Cooking ☐ Cleaning/Bathing ☐ Lawn Maintenance/Gardening
   ☐ Other: Please specify _____
9. Do you have common problems with low water system pressure?
   ☐ Yes ☐ No
10. Do you have a septic system?
    ☐ Yes ☐ No ☐ Not Used ☐ Don't Know
11. Is there a yard (e.g., lawn, garden, et cetera) area at your property?
    ☐ Yes ☐ No
12. If yes to question 11, is the yard area included in your lease?
    (Look under the Premise Identification Number on the first page of the lease)
    ☐ Yes ☐ No ☐ Don't Know
13. If yes to question 11, what do you use the yard for? (check all that apply)
    ☐ Recreation ☐ Outdoor Dining ☐ Children's Play Area ☐ Gardening
    ☐ Other: Please specify _____
14. If you garden, what do you grow? _____
15. Do you eat the produce that you grow?
    ☐ Yes ☐ No
16. Do you personally landscape or mow the lawn?
    ☐ Yes ☐ No
17. Do you live near routine open burning?
    ☐ Yes ☐ No
18. If yes to question 17, identify what is commonly burned (check all that apply).
    ☐ Garbage in Dumpsters ☐ Garbage in Streets/Lots
    ☐ Agricultural Burning (such as tree limbs, etc.)

Enclosure (4)

19. If yes to question 17, approximately how close is the open burning to your residence?
    _____ (miles)
20. What is your landlord's name? _____
21. What is your landlord's phone number? _____
22. Please use the box below to draw a map to your house (from the nearest main road) and if known, please provide GPS coordinates: _____
    (Please feel free to attach additional paper or Google map, etc.)

Enclosure (4)

U.S. NAVAL SUPPORT ACTIVITY NAPLES, ITALY

Naples Community Health Awareness

Visual Inspection Of Properties

Sample Location _____ **Date** _____ **Time** _____

FIRST: Obtain and review the completed Questionnaire that the resident submitted with their interest to participate in this assessment.

SECOND: Obtain Tenants signature on the Consent form before starting any sampling activities.

Review the items below, and based on a visual inspection of the *accessible* areas of the property, check any items that you observe:

YES	NO	
☐	☐	Areas of stressed vegetation. Describe nature and area/size _____ _____
☐	☐	Well head on property _____
☐	☐	Waste/refuse visible on or in close proximity to property. Describe: _____
☐	☐	Swimming pool, size, type_____
☐	☐	Garden or fruit trees on property _____
☐	☐	Visible waste burning near property. Describe: _____ _____
☐	☐	Neighboring industrial activity (describe, and note if it appears to be active or abandoned). _____
☐	☐	Evidence of underground tanks, landfill activities, etc.. (e.g., pipe stick up vents, fill pipes or vents, manhole covers, septic tank, etc.) _____
☐	☐	Other pertinent information and comments from tenant: _____ _____ _____

2.0 PILOT STUDY RESULTS

Prior to commencing the Phase I ETSA, it was decided to conduct a Pilot Study on a small number of homes to assess the technical and logistical issues associated with the Phase I ETSA. Specifically, this Pilot Study addressed contacting residents and landlords, scheduling sampling events, collecting samples, shipping samples to the laboratory, collecting data from the laboratory, evaluating the data, and relaying the information to the public.

The Pilot Study was conducted during the week of April 28, 2008, and it included seven residences selected from a group of 16 volunteer homes identified by the Navy (Figure 1-1). The following samples were obtained from all of the pilot-study homes:

- Tap water from the kitchen faucet
- Soil samples from the yard

At two of the pilot-study homes, the following ambient air samples were also obtained:

- PM-10 metals
- Dioxins/furans
- Pesticides/polychlorinated biphenyls (PCBs)
- SVOCs
- VOCs using a Summa-type canister

Pilot Study results can be found in Appendix A.

2.1 AIR SAMPLES

Table 2-1 presents the chemicals that were detected in the air samples collected at two homes during the Pilot Study. Descriptive statistics of these results are presented in Table 2-2. Summaries of the data separated by analytical fractions are presented in the following subsections. Figure 2-1 shows the locations of residences where the air samples were collected during the Pilot Study. Concentrations were compared to EPA risk-based air Regional Screening Levels (RSLs). The RSLs are risk-based levels that correspond to a cancer risk of 1 x 10-6 or a hazard quotient of 1.0. The RSLs were derived to be protective of residential inhalation exposure of the contaminants.

2.1.1 PM-10 Metals

Arsenic, cadmium, chromium, and cobalt were the only metals detected at concentrations exceeding the RSLs. Concentrations of arsenic, chromium and cobalt exceed RSLs in the air sample collected from the residence in Study Area 5 and concentrations of cadmium, chromium and cobalt exceeded RSLs in the air sample collected at the residence in Study Area 6.

2.1.2 Mercury Vapor

Mercury vapor was not detected in either of the two air samples collected during the Pilot Study.

2.1.3 Volatile Organic Compounds

Five VOCs were detected in air samples at concentrations exceeding the RSLs. Concentrations of benzene, carbon tetrachloride, ethylbenzene, hexane, and PCE exceeded their RSLs in both air samples collected during the Pilot Study.

2.1.4 Semivolatile Organic Compounds

Three PAHs, benzo(a)pyrene, dibenzo(a,h)anthracene, and naphthalene, were the only SVOCs detected at concentrations exceeding the RSLs. Benzo(a)pyrene and dibenzo(a,h)anthracene concentrations exceeded the RSLs in both air samples collected during the Pilot Study. Naphthalene exceeded the RSL in the air sample collected from the pilot residence in Study Area 5.

2.1.5 Aldehydes and Ketones

No aldehydes or ketones were detected in air samples collected during the Pilot Study.

2.1.6 Pesticides and PCBs

No pesticides or PCBs were detected in air samples collected during the Pilot Study.

2.1.7 Dioxins/Furans

No dioxins/furans were detected in air samples collected during the Pilot Study.

2.2 SOIL SAMPLES

Table 2-3 presents the chemicals that were detected in the seven soil samples collected during the Pilot Study. Descriptive statistics are presented in Table 2-4. Concentrations were compared to EPA risk-

based residential soil RSLs. The RSLs correspond to a cancer risk of 1 x 10-6 or a hazard quotient of 1.0. The RSLs were derived to be protective of residents directly exposed to soil through incidental ingestion and inhalation of particulates. A summary of the soil results is provided below.

- Dioxins/furans were detected in six of the soil samples. Dioxins/furans concentrations are expressed in terms of toxicity equivalents (TEQ) of 2,3,7,8-tetrachlorodibenzodioxin (2,3,7,8-TCDD). Dioxins/furans are a group of compounds that are chemically and toxicologically similar; therefore, a concentration expressed in terms of the 2,3,7,8-TCDD concentration simplifies the toxicological evaluation of dioxins/furans. The derivation of these concentrations is explained in greater detail in Volume II of this document. The TEQ concentrations ranged from 0.0055 ng/kg to 4.8955 ng/kg and exceeded the RSL in one sample. Figure 2-2 shows the location of the 2,3,7,8-TCDD equivalents concentration exceedances.

- Six VOCs were detected in the soil samples collected during the Pilot Study. Ethylbenzene was the most frequently detected VOC being detected in five samples at estimated concentrations ranging from 0.0006 mg/kg to 0.0015 mg/kg. o-Xylene was detected in four samples at estimated concentrations ranging from 0.0003 mg/kg to 0.0004 mg/kg. Styrene was detected in four samples at estimated concentrations ranging from 0.0003 mg/kg to 0.0015 mg/kg. The remaining VOCs were detected in two or fewer samples. Concentrations of all VOCs were less than RSLs.

- Ten SVOCs were detected in the soil samples. Di-n-octyl phthalate was detected in four samples at concentrations ranging from 0.03 J mg/kg to 1.36 mg/kg, which are less than the RSL. Bis(2-ethylhexyl)phthalate was detected in three samples at estimated concentrations ranging from 0.13 mg/kg to 0.31 mg/kg, which are less than RSLs. The remaining SVOCs were detected in two or less samples. Concentrations of carcinogenic PAHs exceeded the RSLs in one sample. Figure 2-3 shows the location of the carcinogenic PAH exceedance.

- No pesticides or PCBs were detected in any of the soil samples collected during the Pilot Study.

- Inorganics were detected frequently in soil samples with most inorganics being detected in all seven soil samples collected during the Pilot Study. Concentrations of arsenic exceeded the RSL in all seven soil samples.

In summary, dioxins/furans (one sample), carcinogenic PAHs (one sample), and arsenic (seven samples) concentrations exceeded the RSLs in soil samples collected during the Pilot Study.

2.3 TAP WATER SAMPLES

This section presents results for tap water samples collected during the Pilot Study from houses that received their water from a municipal water supply and from houses that received water from private wells or unknown sources. Figure 2-1 illustrates the source of the water supply for the pilot residences. Concentrations were compared to EPA risk-based tap water RSLs, EPA maximum contaminant levels (MCLs), and action levels, where appropriate. The RSLs correspond to a cancer risk of 1 x 10-6 or a hazard quotient of 1.0. The tap water RSLs were derived to be protective of residential exposure to water through ingestion and inhalation. MCLs are legally enforceable standards that apply to public water systems. Action levels apply to copper and lead and are concentrations that trigger monitoring requirements of a water system.

The MCLs for nitrate and nitrite are reported in terms of the concentration of nitrogen in the water. However, the laboratory is reporting tap water concentrations of nitrate and nitrite as the anion. Therefore, for purposes of comparison in this report, the MCLs were converted to nitrate and nitrite concentrations by multiplying the MCL by a factor corresponding to the percent composition of nitrogen (relative to its molecular weight) in the anion.

2.3.1 Houses Supplied by Municipal Water

Table 2-5 presents the chemicals that were detected in five tap water samples collected from dwellings that received their water from a municipal water supply. Descriptive statistics are presented in Table 2-6. VOCs, dioxins/furans, inorganics, chloride, fluoride, nitrate, sulfate, and gross alpha and gross beta radioactivity were frequently detected in these municipal tap water samples.

- Nine VOCs were detected in the five tap water samples collected from houses that were identified as being supplied by municipal water sources. VOCs were detected infrequently in the tap water samples with the exception of chlorodibromomethane, chloroform, and tetrachloroethene (PCE). Chlorodibromomethane was detected in four samples at concentrations ranging from 0.359 J ug/L to 1.31 ug/L with the maximum concentration exceeding the tap water RSL, but less than the Maximum Contaminant Level (MCL) in all samples. Chloroform was detected in one sample at a concentration of 0.228 J ug/L. The detected concentration of chloroform exceeded the tap water RSL and inhalation RSL but was less than the MCL. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment. PCE was detected in one sample at a concentration of 2.42 ug/L. The detected concentration of PCE exceeded the tap water RSL and inhalation RSL but was less than the MCL. Figure 2-4 shows the locations of the PCE exceedances.

- Dioxins/furans were detected in two of five municipal water samples in the Pilot Study. The 2,3,7,8-TCDD TEQs ranged from 0.00031 ng/L to 0.000384 ng/L, which were less than the tap water RSL.

- No SVOCs, pesticides, or PCBs were detected in the municipal tap water samples collected during the Pilot Study.

- Twenty-one inorganics were detected in the municipal tap water samples. The concentrations of arsenic exceeded the tap water RSL in all five samples, but were less than the MCL. The concentrations of the other inorganics were less than RSLs and MCLs in all samples.

- Chloride, fluoride, nitrate, and sulfate were detected in the all municipal tap water samples. The concentrations of these parameters were less than the tap water RSLs and MCLs in all samples.

- Gross alpha and gross beta radioactivity were not detected in municipal tap water samples.

- No microbiological parameters were detected at concentrations exceeding the MCLs.

In summary, concentrations of VOCs (one samples) and arsenic (five samples) exceeded RSLs or MCLs in the municipal tap water samples collected during the Pilot Study.

2.3.2 Houses Supplied by Wells or Unknown Sources

Table 2-7 presents the chemicals that were detected in two tap water samples collected from dwellings that received their water from wells or unknown sources during the Pilot Study. Descriptive statistics are presented in Table 2-8. VOCs, dioxins/furans, inorganics, chloride, fluoride, nitrate, sulfate, gross alpha and gross beta radioactivity, and microbiological parameters were detected in the tap water samples.

- Bromoform, chlorodibromomethane, chloroform, and PCE were detected in the two tap water samples collected from houses supplied by wells or unknown sources. Concentrations of bromoform, chlorodibromomethane, and chloroform were less than the RSLs and MCLs in both samples. PCE was detected in one sample at a concentration of 13.9 ug/L. The detected concentration of PCE exceeded the tap water and inhalation RSLs, the MCL, and was greater than 100 times the tap water RSL. Figure 2-4 shows the location of the PCE exceedance.

- Dioxins/furans were detected in both samples. The 2,3,7,8-TCDD equivalent concentrations (TEQs) were less than the tap water RSL and MCL in all samples.

- No SVOCs, pesticides, or PCBs were detected in tap water samples collected from houses supplied by wells or unknown sources during the Pilot Study.

- Seventeen inorganics were in the municipal tap water samples. The concentrations of arsenic exceeded the tap water RSL in both tap water samples, but were less than the MCL. Copper exceeded its action level in one sample. The concentrations of the other inorganics were less than RSLs and MCLs in all samples. Figure 2-5 shows the location of the copper action level exceedance.

- Chloride, fluoride, nitrate, and sulfate were detected in both tap water samples. Nitrate exceeded the MCL in one sample. Figure 2-6 shows the location of the nitrate MCL exceedance.

- Gross alpha and gross beta radioactivity was reported in both samples. The concentrations of gross alpha and gross beta were less than the MCLs in all samples.

- Fecal coliform and total coliform were reported in one sample. The MCL for these parameters is 0 CFU/100. Therefore, the fecal and total coliform counts exceeded the MCL in the water samples. Figure 2-7 shows the location of the fecal and total coliform MCLs.

In summary, concentrations of PCE, arsenic, copper, and microbial parameters exceeded RSLs or MCLs in tap water samples collected during the Pilot Study from houses supplied by wells or unknown sources during the Pilot Study.

2.4 SOIL GAS SAMPLES

Table 2-9 presents the chemicals that were detected in the five passive near-slab soil gas samples collected during the Pilot Study. Descriptive statistics are presented in Table 2-10. Soil gas concentrations are compared to air RSLs that are multiplied by a factor of ten to account for attenuation of soil gas concentrations migrating from soil into indoor air.

Tridecane and undecane were detected in two passive soil gas samples. Pentadecane, phenanthrene, and tetrachloroethene were detected in one passive soil gas sample. Concentrations of all VOCs were less than the screening levels in all samples.

2.5 SUMMARY

In the two air samples collected during the Pilot Study, PM-10 metals, VOCs, and carcinogenic polycyclic aromatic hydrocarbons (PAHs) were detected at concentrations greater than air RSLs. Arsenic, cadmium, chromium, cobalt, benzene, ethylbenzene, hexane, benzo[a]pyrene, dibenzo[a,h]anthracne,

and naphthalene concentrations exceeded air RSLs and could be attributed to automobile exhaust. Carbon tetrachloride and PCE also exceeded air RSLs and are present at concentrations that could be attributed to urban industrial emissions. Mercury vapor, aldehydes, ketones, pesticides, PCBs, and dioxins/furans were not detected in these two pilot residence air samples.

In the soil samples collected during the Pilot Study, dioxins/furans [expressed in terms of TEQ], carcinogenic PAHs [expressed in terms of benzo[a]pyrene equivalents (BaPEq)], and arsenic were detected at concentrations greater than their RSLs. VOCs, pesticides, and PCBs were not detected in the seven pilot residence soil samples (Table 2-11).

In the tap water samples collected from residences connected to a municipal water supply, trihalomethanes and PCE were detected at concentrations greater than RSLs, but less than MCLs. Arsenic was detected at concentrations greater than the RSL in all samples, and greater than the MCL in two samples. TEQ and anion concentrations were less than RSLs and MCLs. SVOCs, pesticides, PCBs, and gross alpha and beta radiation were not detected. Bacteriological parameters were all less than their MCLs (Table 2-11).

In the tap water samples collected from residences connected to a well or unknown source, PCE, arsenic, and nitrate were detected at concentrations greater than RSLs and MCLs. Copper was detected at a concentration greater than its action level. Total and fecal coliform were detected at levels greater than the MCL. Trihalomethanes and TEQ were detected at concentrations less than RSLs. Gross alpha and beta radiation were detected at levels less than their MCLs. SVOCs, pesticides, and PCBs were not detected (Table 2-11).

In the passive near-slab soil gas samples, no VOCs were detected at concentrations greater than screening levels.

Conclusions and lessons learned from the pilot program were incorporated into a revised sampling approach and schedule as appropriate.

- Although air sampling at the two pilot residences succeeded, it demonstrated that physical and logistical challenges could be anticipated in doing this sampling at private residences, as well as being an inconvenience to the residents. For example, occasional tripping of circuits warranted recurring interruption of residents' daily schedules during the 24-hour sampling period. Moreover, the presence of field personnel at the residences for the entire 24-hour period was intrusive to the residents. It was clear that sampling could be conducted with greater efficiency and be less intrusive

if conducted at the government-based properties at locations strategically located within the nine study areas.

- The presence of VOCs, specifically PCE, in tap water suggested that vapor intrusion could be a significant pathway. This warranted the addition of passive near-slab soil gas sampling as part of the Phase I investigation.

- The presence of contamination in tap water suggested that other constituents should be added to the analyte list. Specifically, anions, radiological parameters, and bacteriological parameters were added to the list.

The Pilot Study also benefited this overall Phase I ETSA by providing an opportunity to develop, test and refine the processes anticipated to be used and involved in the investigation. This included aspects such as: developing and implementing a process for obtaining appropriate Navy Command approval for personnel to be released from their on-base duties so that they could be present at their residence during sampling; developing and testing communication pathways between US personnel and landlords; establishing the mechanisms and documents to facilitate informing US personnel of the study to invite and encourage volunteers and to also provide those persons with the means to volunteer; assessing the effectiveness and efficiency of shipping samples internationally for analysis, and other aspects. Another key element that was identified during the planning and development of the Pilot Study was assessing how properties would be geographically located because of known and anticipated inaccuracies with resident addresses available from Navy Housing as well as inaccuracies with street and house markings in the Campania region.

3.0 AIR SAMPLING RESULTS

The objective of the air sampling aspect of the Phase I ETSA was to measure the representative concentrations of contaminants in air, some of which may be attributable to the random burning of trash throughout the Naples area of Campania. Continuous ambient air monitoring of criteria pollutants (ozone, sulfur dioxide, carbon monoxide, and oxides of nitrogen) was conducted at Gricignano Support Site, through the installation and use of Continuous Air Monitoring (CAM) devices that were integrated with the meteorological monitoring system. The purpose for collecting meteorological data is to obtain information on general air conditions and wind directions to better understand and interpret the potential impacts associated with the analytical data. In addition, air samples were collected from nine air monitoring stations located throughout the Naples area of Campania and were analyzed for PM-10 metals, mercury vapor, volatile organic compounds, semivolatile organic compounds, aldehydes and ketones, pesticides, PCBs, and dioxins/furans. The complete set of air data collected during Phase I can be found in Appendix B.

The nine air monitoring stations were located at government-based properties to ensure protection of the sampling equipment and because the provision of electrical services at these locations was presumed to be more reliable than off-base properties. The locations of these stations are illustrated in Figure 1-13. Each location was intended to represent a specific Study Area, which were defined by commune boundaries. The locations of the air monitoring stations and the communes included in these Study Areas are listed in Table 3-1.

Air sampling for the Phase I ETSA was conducted over a 30-day period. Sampling began on July 7, 2008 and ended on August 8, 2008. Five samples for each contaminant group were collected over the 30-day period at each of the nine study area sampling stations (resulting in a total of 45 sampling events for each air sampling parameter over this period).

The analytical results from the Phase I ETSA air sampling were compared to air RSLs. The RSLs correspond to a cancer risk of 1×10^{-6} for carcinogens and a hazard index of 1.0 for noncarcinogens. Descriptive statistics of the data collected from the individual study areas and from the region are presented in Tables 3-2 through 3-11. Table 3-12 provides a summary of urban background concentrations, typically found in the United States, of those constituents that were detected at levels greater than their air RSLs. Summaries of the air data by chemical fraction follow.

3.1 CRITERIA POLLUTANTS

A CAM system is located at the Support Site. This system continuously monitors ambient concentrations of criteria pollutants (i.e., sulfur dioxide, carbon monoxide, nitrogen oxide, nitrogen monoxide, nitrogen dioxide, and ozone) which have National Ambient Air Quality Standards (NAAQS) in the United States for averaging periods ranging from one hour to one year. Data for these parameters were collected at time intervals of 1-hour, 3-hour, 8-hour, and 24-hours, with time-weighted average concentrations for these intervals. These values are presented in Appendix B in Tables A, B, C, and D**,** respectively. The "NULL" entries in these four tables represent periods when the data logger was inoperable due to power failures, maintenance activities, or equipment calibrations.

During the period between July 8 and August 8, there were no exceedances of NAAQS for sulfur dioxide, carbon monoxide, nitrogen dioxide, and ozone. In addition, there were no exceedances for alternate standards set by the European Union (EU) and the World Health Organization (WHO). In general, maximum concentrations, with the exception of ozone, were well below all applicable air quality standards. In the case of ozone, there was one 8-hour concentration (171µg/m^3) that exceeded the 8-hour standard value of 157 µg/m^3. However, it is important to qualify this "exceedance" because in order to attain the NAAQS of 157 µg/m^3 for ozone, a 3-year average of the fourth-highest daily maximum 8-hour average ozone concentrations must not exceed 157µg/m^3. The fourth highest ozone concentration reported in Phase I was 138 µg/m^3. Therefore, based on the NAAQS specified criteria, this one result did not meet the definition of a true exceedance.

Further review of hourly ozone concentrations indicates a diurnal cycle in concentrations that, on average, peaks at about 1400 hours and is lowest at 0700 hours. A comparison of the maximum versus average hourly air concentration for each hour of the day is presented in Figure 3-1. The higher levels of ozone during the daylight hours are presumably attributed to increased automobile and truck emissions, accompanied by sunny, hot weather conditions with little or no wind.

Negative air concentrations were reported at times for all parameters with the exception of ozone. Negative concentrations can be reported as a result of several factors, which include natural drift of the gas analyzers over time, very low ambient concentrations for an extended period, and occasional equipment malfunctions. The continuous air quality sampling system used in Phase I was maintained under a maintenance/services agreement. During this sampling event, the equipment was monitored weekly via remote modem connection and was given a detailed evaluation and calibration (zero and span) during periodic onsite visits. The most recent onsite visit for maintenance included replacement of certain items of equipment, and performing zero/span calibrations to bring the monitoring system back into specifications.

3.2 PM-10 METALS

Table 3-13 presents the PM-10 metals and the 24-hour PM-10 air concentrations that were detected in the 45 air samples collected at the nine study areas. There were no violations of the PM-10 24-hour NAAQS standard (150 µg/m^3) during the Phase I sampling period of July 7, 2008 through August 8, 2008. In fact, all PM-10 24-hour concentrations were less than 100 µg/m^3, with the exception of one sample collected on August 1, 2008 at Capodichino, which measured 127 µg/m^3. Arsenic (maximum concentration of 0.01 µg/m^3), cadmium (maximum concentration of 0.003 µg/m^3), chromium (maximum concentration of 0.028 µg/m^3), and cobalt (maximum concentration of 0.001 µg/m^3) were the only metals detected at concentrations exceeding the RSLs. Concentrations of arsenic and chromium exceeded the RSLs in air samples from all nine study areas. Cobalt exceeded the RSLs in all study areas except at the JFC NATO Site and Carney Park. Cadmium only exceeded the RSLs in two samples collected at Capodichino. As shown in Table 3-12, average concentrations of arsenic, cadmium, chromium, and cobalt detected across the region are consistent with what is typically detected in urban environments. Their presence could be related to diesel exhaust.

3.3 MERCURY VAPOR

Table 3-13 presents the vapor phase mercury sampling results for the 45 air samples collected at the nine study areas. Vapor phase mercury was detected in 44 samples at a range of 0.0005 to 0.0037 µg/m^3. However, all of these detected concentrations of vapor phase mercury were less than the air RSL.

3.4 VOLATILE ORGANIC COMPOUNDS

Table 3-14 presents the VOCs that were detected in some of the 45 air samples collected at the nine study areas across the Naples area of Campania during the Phase I ETSA. Nineteen VOCs were detected at concentrations exceeding the RSLs with exceedances occurring in all nine study areas. Chemicals which were most frequently detected at concentrations exceeding the RSLs included 1,2-dichloropropane (maximum concentration of 8.81 µg/m^3), acetaldehyde (maximum concentration of 86.8 µg/m^3), acrolein (maximum concentration of 6.92 µg/m^3), benzene (maximum concentration of 6.82 µg/m^3), carbon tetrachloride (maximum concentration of 1.06 µg/m^3), chloroform (maximum concentration of 0.7 µg/m^3), chloromethane (maximum concentration of 38.6 µg/m^3), ethylbenzene (maximum concentration of 3.84 µg/m^3) , and PCE (maximum concentration of 10.1 µg/m^3). These chemicals exceeded their RSLs in more than half of the samples. While several VOCs were detected at concentrations exceeding the RSLs, the detected concentrations are typical of US urban background concentrations. For example, as shown in Table 3-12, average concentrations of chlorinated hydrocarbons detected across the region, including carbon tetrachloride, chloroform, chloromethane,

PCE, and 1,2-dichloropropane are consistent with what is typically detected in urban environments. Acetaldehyde, acrolein, benzene, ethylbenzene are compounds that were detected and these substances are commonly associated with exhaust emissions from diesel and gasoline combustion engines, which are prevalent in the Naples area.

3.5 SEMIVOLATILE ORGANIC COMPOUNDS

Table 3-15 presents the SVOCs that were detected in some of the 45 air samples collected at the nine study areas across the Naples area. SVOCs were detected frequently in the air samples from the nine study areas. Two PAHs, benzo(a)pyrene (maximum concentration of 0.005 µg/m^3) and dibenzo(a,h)anthracene (maximum concentration of 0.006 µg/m^3), were the only SVOCs detected at concentrations exceeding the RSLs. Concentrations of benzo(a)pyrene exceeded the RSLs in two samples collected at Parco Eva. Concentrations of dibenzo(a,h)anthracene exceeded the RSLs in one sample at Parco Eva. As shown in Table 3-12, average concentrations of benzo(a)pyrene and dibenzo(a,h)anthracene detected across the region are consistent with what is typically detected in urban environments. As with the VOCs, the presence of PAHs could be attributed to diesel or gasoline exhaust emissions.

3.6 ALDEHYDES AND KETONES

Table 3-16 presents the aldehydes and ketones that were detected in some of the 45 air samples collected at the nine study areas across the Naples area during the Phase I ETSA. Aldehydes were detected frequently in the air samples from the nine study areas. Acetaldehyde (maximum concentration of 2.24 µg/m^3) and formaldehyde (maximum concentration of 4.54 µg/m^3) were the only aldehydes detected at concentrations exceeding the RSLs. Acetaldehyde exceeded the RSLs in 16 air samples collected from all the study areas except for Parco Eva. Concentrations of formaldehyde exceeded the screening level in all 45 air samples collected at the nine study areas. The presence of these constituents could be related to diesel exhaust emissions. As shown in Table 3-12, average concentrations of acetaldehyde and formaldehyde detected across the region are consistent with what is typically detected in urban environments. No ketones were detected at concentrations exceeding the RSLs in any air sample.

3.7 PESTICIDES AND PCBS

Table 3-17 presents the pesticides that were infrequently detected in some of the 45 air samples collected at the nine study areas across the Naples area during the Phase I ETSA. PCBs were not detected in any of the 45 air samples. Dieldrin (maximum concentration of 0.012 µg/m^3) was the only pesticide detected at concentrations exceeding the RSLs. Concentrations of dieldrin exceeded the RSLs

in one sample at each of the following study areas: the U.S. Consulate, Capodichino, the Lago Patria Receiver Site, Parco Eva, the Villa, and Parco Le Ginestre. No pesticides were detected in any of the air samples from the JFC NATO Site, Carney Park, and Parco Eva. Also as shown in Table 3-12, the average concentration of dieldrin detected across the region is consistent with what is commonly detected in US urban environments.

3.8 DIOXINS/FURANS

Table 3-18 presents the dioxins/furans that were detected in the 45 air samples collected at the nine study areas across the Naples area during the Phase I ETSA. Dioxins/furans were detected in air samples from all nine study areas. Concentrations of dioxins/furans, expressed as TEQ (maximum concentration of 0.013 ng/m^3), exceeded the RSLs in all study areas. Dioxins/furans concentrations were highest at the Gricignano Support Site. As shown in Table 3-12, the average concentration of dioxins/furans detected across the region are consistent with what is commonly detected in US urban environments. Overall, the presence of dioxins/furans could be related to diesel exhaust in combination with industrial emissions.

3.9 SUPPORT ACTIVITY METEOROLOGICAL MONITORING

The location of the meteorological tower at the Support Site is shown on Figure 3-2 relative to study areas associated with the investigation and includes a superimposed figure of the wind rose for data collected during the period June 28, 2008 through August 8, 2008. A separate, larger version of the wind rose is presented in Figure 3-3. A listing of the hourly meteorological data reported at the Support Site monitoring station for the period is presented in Appendix B. The meteorological parameters measured at the tower include wind speed, wind direction, standard deviation of the wind direction (sigma theta), delta temperature (ΔT) between 10 meters and 2 meters, solar radiation, barometric pressure, and rainfall. The sigma theta, delta temperature (ΔT), and solar radiation parameters are used to determine atmospheric stability. All meteorological parameters have been validated using U.S. EPA quality assurance guidance.

During the July 8 to August 8 Phase I ETSA air sampling period, the prevailing wind direction for the Support Site was west-southwest (18.3%). Other prevailing directions having relatively high frequencies included west (14.7%), east (13.1%), and east-southeast (11.4%). The average wind speed for the period was 2.2 meters/second (5 miles per hour). Calm winds (less than 0.5 m/sec) were reported 1.5% of the time. In general, wind speeds for the period were relatively low with about 60% of the hourly speeds being in the range of 0.5 m/sec to 2.1 m/sec (1.0 mph to 4.7 mph). A diurnal cycle of east winds during the morning hours and southwest winds during the afternoon was apparent for numerous days

during the period, which explains the predominantly east and west orientation of the wind rose. The change from east to west winds generally occurred in the period 1100 hours to 1300 hours (Figure 3-4).

The average temperature for the period was 25.6°C (78.2°F). The maximum and minimum temperatures for the period were 33.7°C (94.2°F) and 0.3°C (32.5°F). Precipitation for the period was well below normal. The normal precipitation for Naples in July is about 24mm. Precipitation in the amount of 2.6mm fell only on June 28, 2008. No rain was reported at the site for the remainder of the period.

3.9.1 Other Regional Meteorological Data

In additional to the Support Activity meteorological data, additional data have been obtained from two other reporting stations located in the Naples region to help characterize wind patterns across the study area. These additional stations are located at the airports in Capodichino and Grazzanise, Italy and collect measurements of several meteorological parameters including, but not limited to wind speed and direction, temperature, dew point, and barometric pressure. Wind speed and wind direction data from these locations, for the period July 1, 2008 through August 8, 2008, have been validated and used to construct wind roses. The wind roses for Grazzanise and Capodichino airports are shown together with the Support Activity wind rose in Figure 3-2, and separately in Figures 3-4, and 3-5, respectively.

During the Phase I sampling period, the Capodichino prevailing wind direction was from the south 39.4% of the time (Figure 3-5). Other wind directions having relatively high frequencies included south-southwest (14.9 percent) and west (13.1 percent). At the Grazzanise airport in Phase I, the prevailing wind direction (Figure 3-4) was from the west (18.6 percent), followed by west-southwest (16.3 percent). It is important to note that these frequencies have been determined on the basis of wind speeds equal to or greater than 4.6 mph because both stations only report wind speed below this threshold as either calm or light/variable and with no associated wind direction. Based on this reporting procedure, the percent of calm and light/variable winds at Capodichino and Grazzanise were 53.6 and 13.27 percent, respectively. The average wind speeds for Capodichino and Grazzanise for the period were 7.5 mph and 5.4 mph, respectively.

Diurnal wind patterns were also observed at Grazzanise and Capodichino airports during the period. For example, at Grazzanise Airport the winds were generally from the east during the night hours of 2300 through about 1000 hours the next morning. After 1000 hours, the wind generally veered to a more southwestly direction until about 2300 hours. This diurnal pattern is similar to the pattern reported for the Support Site. In the case of the Capodichino airport, there was generally an extended period of very light and variable winds between 2000 until 0900 the next morning. After 0900, the wind speeds generally increased and the prevailing wind direction became more south to southwesterly until about 2000. Because the Capodichino airport is located close to the Gulf of Naples, this diurnal pattern may be

indicative of a sea breeze that develops due to the increasing temperature differences between the land and water during the daylight hours.

3.10 SUMMARY OF AIR DATA

The results of the Phase I air sampling indicate that concentrations of air contaminants detected across the region are typical of what is detected in urban environments. The chemicals that were detected across the region can be attributed to automobile exhaust and industrial emissions. There were no violations of the PM-10 24-hour NAAQS standard (150 $\mu g/m^3$) during the Phase I sampling period of July 7, 2008 through August 8, 2008.

Arsenic, cadmium, chromium, and cobalt were detected across the region at concentrations greater than air RSLs. Arsenic and chromium were detected in all samples at concentrations greater than RSLs. Nineteen VOCs were detected at concentrations exceeding the RSLs with exceedances occurring in all nine study areas. 1,2-Dichloropropane, acetaldehyde, acrolein, benzene, carbon tetrachloride, chloroform, chloromethane, ethylbenzene, and PCE exceeded RSLs in more than half of the samples. While several VOCs were detected at concentrations exceeding the RSLs, the detected concentrations are typical of US urban background concentrations. Two PAHs, benzo(a)pyrene and dibenzo(a,h)anthracene, were the only SVOCs detected at concentrations exceeding the RSLs. Acetaldehyde and formaldehyde were the only aldehydes detected at concentrations exceeding the RSLs. Concentrations of formaldehyde exceeded the screening criteria in all 45 air samples collected at the nine study areas. Pesticides were detected infrequently in air samples from the nine study areas. Dieldrin was the only pesticide detected at concentrations exceeding the RSLs. Dioxins/furans were detected in air samples from all nine study areas. Concentrations of dioxins/furans, expressed as 2,3,7,8-TCDD equivalent concentrations, exceeded the RSLs in all study areas except for the JFC NATO Site and Carney Park. Dioxins/furans concentrations were highest at the Gricignano Support Site. Mercury vapor was detected at concentrations less than RSLs in all samples. No PCBs were detected in any air sample.

4.0 SOIL SAMPLING

Soil samples were proposed to be collected from 130 residences on the economy throughout the Naples area of Campania, with samples assigned to nine study areas (Table 1-1), defined by the locations of the air monitoring stations. However, at some residences, soil was not available for sample collection. The boundaries of the nine study areas are illustrated in Figure 1-13. Figure 4-1 illustrates the locations of the soil samples collected across the nine study areas as part of this Phase I ETSA. Additionally, 30 soil samples were collected from government-leased Parcos, six samples were collected from Field Quarters, and several soil samples were collected from government-based properties (Table 1-6). Composite surface soil samples (0 to 6 inches below ground surface) were collected from each residence. In addition, discrete soil samples were collected from each location for VOC analysis. The soil samples were analyzed for VOCs, SVOCs, dioxins/furans, pesticides, PCBs, and metals. The complete set of soil data can be found in Appendix C.

The data were compared to soil residential RSLs. The RSLs correspond to a cancer risk of 1×10^{-6} and a hazard index of 1.0 for carcinogens and noncarcinogens, respectively. Summaries of the soil data, separated by study area, Parco, and government-based properties are presented in the following sections.

4.1 ECONOMY HOUSES

4.1.1 Study Area 1

Table 4-1 presents the chemicals that were detected in the 20 soil samples collected from Study Area 1. Descriptive statistics are presented in Table 4-2.

- Dioxins/furans were frequently detected in all soil samples. The TEQ concentrations ranged from 0.08623 ng/kg to 4.4318 ng/kg, which are less than the residential RSL.

- Thirty-four VOCs were detected in the soil samples collected at Study Area 1. Overall VOCs were detected infrequently in the soil samples. Toluene was the most frequently detected VOC being detected in seven samples at estimated concentrations ranging from 0.000763 mg/kg to 0.00981 mg/kg. Acetone was detected in six samples at estimated concentrations ranging from 0.00731 mg/kg to 0.0494 mg/kg. The remaining VOCs were detected in five or less samples. The concentrations of all VOCs were less than the residential RSLs.

- Fourteen SVOCs were detected in the soil samples. With the exception of bis(2-ethylhexyl)phthalate, SVOCs were detected infrequently in soil sample. Bis(2-ethylhexyl)phthalate was detected in 10 samples at concentrations ranging from 0.145 J mg/kg to 1.91 mg/kg. The remaining SVOCs were detected in four or less samples. Only concentrations of carcinogenic PAHs exceeded the screening level in three samples.

- Nine pesticides were detected in the soil samples. Heptachlor epoxide was the most frequently detected pesticide, was detected in three samples at concentrations ranging from 0.011 to 0.0174 mg/kg. 4,4'-DDE and endosulfan sulfate were detected in two samples. The remaining pesticides were detected in only one sample. The concentrations of all pesticides were less than their residential RSLs.

- No PCBs were detected in any of the soil samples from Study Area 1.

- Inorganics were detected frequently in soil samples with the exception of mercury, which was only detected in one sample. Most inorganics were detected in all 20 soil samples collected in Study Area 1. Concentrations of arsenic exceeded its residential RSL in all 20 samples.

In summary, concentrations of dioxins/furans, VOCs, and pesticides were less than the screening criteria. PCBs were not detected in Study Area 1 soil samples. Concentrations of carcinogenic PAHs (three samples) and arsenic (20 samples) exceeded their residential RSLs in soil samples collected from Study Area 1. Figure 4-2 shows the locations of the carcinogenic PAHs RSL exceedances.

4.1.2 Study Area 2

No soil samples were collected at Study Area 2. The residences sampled in this Study Area are in the downtown section of Naples where soil at an individual residence was not available for sampling.

4.1.3 Study Area 3

Table 4-3 presents the chemicals that were detected in the three soil samples collected from Study Area 3. Descriptive statistics are presented in Table 4-4.

- Dioxins/furans were detected in all soil samples. The TEQ concentrations ranged from 0.63344 ng/kg to 2.7655 ng/kg, which are less than the residential RSL.

- Nine VOCs were detected in the soil samples collected from Study Area 3. 1,1,2-Trichlorotrifluorethane was detected in two samples at estimated concentrations of 0.002394 mg/kg

and 0.183 mg/kg. Acetone was detected in two samples at estimated concentrations of 0.0107 mg/kg and 0.0586 mg/kg. Toluene was also detected in two samples at estimated concentrations of 0.00517 mg/kg and 0.0237 mg/kg. The remaining VOCs were only detected in one sample. The concentrations of all VOCs were less than their residential RSLs.

- Nine SVOCs were detected in the soil samples. Chrysene was detected in two soil samples at concentrations of 0.009775 J mg/kg and 0.0427 J mg/kg. The remaining SVOCs were detected in only one sample. Concentrations of carcinogenic PAHs exceeded its residential RSL in one sample.

- 4,4'-DDE and endosulfan sulfate were the only pesticides detected in soil samples and were only detected in one soil sample. The detected concentrations of 4,4'-DDE (0.00122 J mg/kg) and endosulfan sulfate (0.0675 mg/kg) were less than their residential RSLs.

- No PCBs were detected in any of the soil samples from Study Area 3.

- Inorganics were detected in all three soil samples. Concentrations of arsenic exceeded its residential RSL in all three samples.

In summary, concentrations of dioxins/furans, VOCs, and pesticides were less than the screening levels. PCBs were not detected in Study Area 3 soil samples. Concentrations of carcinogenic PAHs (one sample) and arsenic (three samples) exceeded their residential RSLs in soil samples collected from Study Area 3. Figure 4-2 shows the locations of the carcinogenic PAHs RSL exceedances.

4.1.4 Study Area 4

Table 4-5 presents the chemicals that were detected in the three soil samples collected from Study Area 4. Descriptive statistics are presented in Table 4-6.

- Dioxins/furans were detected in all soil samples. The TEQ concentrations ranged from 0.27777 ng/kg to 1.10098 ng/kg, which are less than the residential RSL.

- 1,1,2-Trichlorotrifluorethane and toluene were the only VOCs detected in the soil samples from Study Area 4. 1,1,2-Trichlorotrifluorethane was detected in two samples at estimated concentrations of 0.00577 mg/kg and 0.0064 mg/kg. Toluene was detected in all three samples at estimated concentrations ranging from 0.00139 mg/kg to 0.00795 mg/kg. The concentrations of 1,1,2-trichlorotrifluorethane and toluene were less than their residential RSLs.

- Bis(2-ethylhexyl)phthalate was the only SVOC detected in the soil samples. Bis(2-ethylhexyl)phthalate was detected in only one sample and the estimated concentration of 0.152 mg/kg was less than its residential RSL.

- Endosulfan II and heptachlor epoxide were the only pesticides detected in soil samples and were only detected in one soil sample. The detected concentrations of endosulfan II (0.0161 mg/kg) and heptachlor epoxide (0.0471 mg/kg) were less than their residential RSLs.

- No PCBs were detected in any of the soil samples from Study Area 4.

- Inorganics were detected in all three soil samples. Concentrations of arsenic exceeded its residential RSL in all three samples.

In summary, concentrations of VOCs, SVOCs, and pesticides were less than their residential RSLs from Study Area 4. PCBs were not detected in any Study Area 4 soil samples. Concentrations of arsenic exceeded its residential RSL in all three soil samples collected from Study Area 4.

4.1.5 Study Area 5

Table 4-7 presents the chemicals that were detected in the 31 soil samples collected from Study Area 5. Descriptive statistics are presented in Table 4-8.

- Dioxins/furans were frequently detected in all soil samples. The TEQ concentrations ranged from 0.00135 ng/kg to 8.427 ng/kg and exceeded its residential RSL in two samples.

- Thirty VOCs were detected in the soil samples collected at Study Area 5. 1,1,2-Trichlorotrifluorethane, acetone, and toluene were the most frequently detected VOCs. 1,1,2-trichlorotrifluorethane was detected in 15 soil samples at estimated concentrations ranging from 0.000848 mg/kg to 0.235 mg/kg. Acetone was detected in 12 samples at estimated concentrations ranging from 0.007785 mg/kg to 0.0485 mg/kg. Toluene was detected in 20 samples at estimated concentrations ranging from 0.000805 mg/kg to 0.14 mg/kg. The concentrations of all VOCs were less than their residential RSLs.

- Thirty-three SVOCs were detected in the soil samples. With the exception of bis(2-ethylhexyl)phthalate, SVOCs were detected infrequently in soil sample. Bis(2-ethylhexyl)phthalate was detected in 13 samples at estimated concentrations ranging from 0.119 mg/kg to 0.774 mg/kg.

The remaining SVOCs were detected in five or less samples. Concentrations of carcinogenic PAHs exceeded its residential RSL in five samples.

- Five pesticides were detected in the soil samples. 4,4'-DDE was detected in two soil samples at estimated concentrations of 0.000588 mg/kg and 0.0007 mg/kg. 4,4'-DDT (0.0009 mg/kg), alpha-chlordane (0.000814 mg/kg), endosulfan I (0.00116 mg/kg), and endosulfan II (0.0183 mg/kg) were detected in one soil sample. Concentrations of all pesticides were less than their residential RSLs.

- No PCBs were detected in any of the soil samples from Study Area 5.

- Inorganics were detected frequently in soil samples with most inorganics being detected in all 31 soil samples collected at Study Area 5. Concentrations of arsenic exceeded its residential RSL in all 31 samples.

In summary, concentrations of VOCs and pesticides were less than their residential RSLs. PCBs were not detected in any soil samples from Study Area 5. Concentrations of dioxins/furans (two samples), carcinogenic PAHs (five samples), and arsenic (31 samples) exceeded their residential RSLs in soil samples collected from Study Area 5. Figure 4-2 shows the locations of the carcinogenic PAHs and 2,3,7,8-TCDD TEQ RSL exceedances.

4.1.6 Study Area 6

Table 4-9 presents the chemicals that were detected in the seven soil samples collected from Study Area 6. Descriptive statistics are presented in Table 4-10.

- Dioxins/furans were frequently detected in all soil samples. The TEQ concentrations ranged from 0.11655 ng/kg to 16.1404 ng/kg and exceeded the screening criteria in two samples.

- Twenty-six VOCs were detected in the soil samples collected at Study Area 6. 1,1,2-Trichlorotrifluorethane, acetone, and toluene were the most frequently detected VOCs. 1,1,2-Trichlorotrifluorethane was detected in four soil samples at estimated concentrations ranging from 0.00474 mg/kg to 0.0236 mg/kg. Acetone was detected in four samples at estimated concentrations ranging from 0.00801 mg/kg to 0.0322 mg/kg. Toluene was detected in five samples at estimated concentrations ranging from 0.000654 mg/kg to 0.0192 mg/kg. The remaining VOCs were detected in three or less soil samples. The concentrations of all VOCs were less than their residential RSLs.

- Ten SVOCs were detected in the soil samples. Fluoranthene was detected in three soil samples at estimated concentrations ranging from 0.0213 mg/kg to 0.065 mg/kg. Phenanthrene was detected in two samples at estimated concentrations of 0.0362 mg/kg and 0.048 mg/kg. Pyrene was also detected in two soil samples at estimated concentrations of 0.0298 mg/kg and 0.0578 mg/kg. The remaining SVOCs were only detected in one sample. Concentrations of carcinogenic PAHs exceeded its residential RSL in one sample.

- No pesticides or PCBs were detected in any of the soil samples from Study Area 6.

- Inorganics were detected frequently in soil samples with most inorganics being detected in all seven soil samples collected at Study Area 6. Concentrations of arsenic exceeded its residential RSL in all seven samples.

In summary, concentrations of VOCs were less than their residential RSLs and pesticides and PCBs were not detected in any soil samples from Study Area 6. Concentrations of dioxins/furans (two samples), carcinogenic PAHs (one sample), and arsenic (seven samples) exceeded their residential RSLs in soil samples collected from Study Area 6. Figure 4-2 shows the locations of the carcinogenic PAHs and TEQ RSL exceedances.

4.1.7 Study Area 7

Table 4-11 presents the chemicals that were detected in the three soil samples collected from Study Area 7. Descriptive statistics are presented in Table 4-12.

- Dioxins/furans were detected in all soil samples. The TEQ concentrations ranged from 0.15246 ng/kg to 1.438 ng/kg, which are less than its residential RSL.

- Twelve VOCs were detected in the soil samples collected at Study Area 7. Toluene was detected in two soil samples at estimated concentrations of 0.000899 mg/kg and 0.0134 mg/kg. m+p-Xylenes were also detected in two soil samples at estimated concentrations of 0.000843 mg/kg and 0.00103 mg/kg. The remaining VOCs were only detected in one sample. The concentrations of all VOCs were less than their residential RSLs.

- Bis(2-ethylhexyl)phthalate was the only SVOC detected in the soil samples. Bis(2-ethylhexyl)phthalate was detected in only one soil sample at an estimated concentration of 0.122 mg/kg , which was less than its residential RSL.

- No pesticides or PCBs were detected in any of the soil samples from Study Area 7.

- Inorganics were detected in all four soil samples. Concentrations of arsenic exceeded its residential RSL in all four samples.

In summary, concentrations of dioxins/furans, VOCs, and SVOCs were less than their residential RSLs and pesticides and PCBs were not detected in any soil samples from Study Area 7. Concentrations of arsenic exceeded its residential RSL in all four soil samples collected from Study Area 7.

4.1.8 Study Area 8

Table 4-13 presents the chemicals that were detected in the 36 soil samples collected from Study Area 8. Descriptive statistics are presented in Table 4-14.

- Dioxins/furans were frequently detected in all soil samples. The TEQ concentrations ranged from 0.03167 ng/kg to 4.3746 ng/kg, which are less than its residential RSL.

- Twenty-six VOCs were detected in the soil samples collected at Study Area 8. VOCs were detected infrequently in the soil samples with the exception of 1,1,2-trichlorotrifluorethane, acetone, and toluene. 1,1,2-Trichlorotrifluorethane was detected in 16 soil samples at estimated concentrations ranging from 0.00111 mg/kg to 0.0108 mg/kg. Acetone was detected in 10 samples at estimated concentrations ranging from 0.00502 mg/kg to 0.208 mg/kg. Toluene was detected in 15 samples at estimated concentrations ranging from 0.000753 mg/kg to 0.135 mg/kg. The remaining VOCs were detected in four or less samples. The concentrations of all VOCs were less than their residential RSLs.

- Twenty SVOCs were detected in the soil samples. With the exception of bis(2-ethylhexyl)phthalate, SVOCs were detected infrequently in soil sample. Bis(2-ethylhexyl)phthalate was detected in 15 samples at estimated concentrations ranging from 0.119 mg/kg to 0.733 mg/kg. The remaining SVOCs were detected in two or less samples. Concentrations of carcinogenic PAHs exceeded its residential RSL in one sample.

- 4,4'-DDT, endosulfan, and endosulfan sulfate were the only pesticides detected in soil samples and were only detected in one soil sample. The estimated concentrations of 4,4'-DDT (0.000805 mg/kg), endosulfan II (0.00133 mg/kg), and endosulfan sulfate (0.00109 mg/kg) were less than their residential RSLs.

- No PCBs were detected in the soil samples from Study Area 8.

- Inorganics were detected frequently in soil samples with the exception of mercury which was only detected in one sample. Most inorganics were detected in all 36 soil samples collected at Study Area 8. Concentrations of arsenic exceeded its residential RSL in all 36 samples.

In summary, concentrations of dioxins/furans and VOCs were less than the screening criteria and pesticides and PCBs were not detected in soil samples from Study Area 8. Concentrations of carcinogenic PAHs (one sample) and arsenic (36 samples) exceeded their residential RSLs in soil samples collected from Study Area 8. Figure 4-2 shows the locations of the carcinogenic PAHs RSL exceedances.

4.1.9 Study Area 9

Table 4-15 presents the chemicals that were detected in the one soil sample collected from Study Area 9. Descriptive statistics are presented in Table 4-16.

- The TEQ concentration was 0.3049 ng/kg, which is less than its residential RSL.

- 1,1,2-Trichlorotrifluorethane, acetone, and toluene were the only VOCs detected in the one soil sample from Study Area 9. The estimated concentrations of 1,1,2-trichlorotrifluorethane (0.0656 mg/kg), acetone (0.0186 mg/kg), and toluene (0.00243 mg/kg) were less than their residential RSLs.

- No SVOCs, pesticides, or PCBs were detected in the one soil sample from Study Area 9.

- Arsenic was the only inorganic detected at a concentration exceeding its residential RSL.

In summary, concentrations of dioxins/furans and VOCs were less than their residential RSLs from Study Area 9. SVOCs, pesticides, and PCBs were not detected in the one soil sample. Arsenic was the only chemical detected in soil from Study Area 9 at a concentration which greater than its residential RSL.

4.2 GOVERNMENT-LEASED PARCOS AND NAVFAC-LEASED HOMES

4.2.1 Parco Artemide

Table 4-17 presents the chemicals that were detected in the 10 soil samples collected from Parco Artemide. Descriptive statistics are presented in Table 4-18.

- Dioxins/furans were frequently detected in all soil samples. The TEQ concentrations ranged from 0.12054 ng/kg to 1.15502 ng/kg, which are less than its residential RSL.

- 1,1,2-Trichlorotrifluorethane, acetone, and toluene were the only VOCs detected in the soil samples from Parco Artemide. 1,1,2-Trichlorotrifluorethane (0.0036 mg/kg) and acetone (0.0307 mg/kg) were detected in one soil sample. Toluene was detected in three samples at estimated concentrations ranging from 0.000587 mg/kg to 0.00296 mg/kg. The concentrations of 1,1,2-trichlorothrifluorethane, acetone, and toluene were less than their residential RSLs.

- Six SVOCs (all PAHs) were detected in only one of the 10 soil samples. Concentrations of carcinogenic PAHs exceeded its residential RSL in one sample.

- No pesticides or PCBs were detected in any of the soil samples from Parco Artemide.

- Inorganics were detected frequently in soil samples with most inorganics being detected in all seven soil samples collected at Parco Artemide. Concentrations of arsenic exceeded its residential RSL in all 10 samples.

In summary, concentrations of dioxins/furans and VOCs were less than their residential RSLs and pesticides and PCBs were not detected in any soil samples from Parco Artemide. Concentrations of carcinogenic PAHs (one sample) and arsenic (10 samples) exceeded their residential RSLs in soil samples collected from Parco Artemide. Figure 4-3 shows the locations of the carcinogenic PAHs RSL exceedances.

4.2.2 Parco Eva

Table 4-19 presents the chemicals that were detected in the 12 soil samples collected from Parco Eva. Descriptive statistics are presented in Table 4-20.

- Dioxins/furans were frequently detected in all soil samples. The TEQ concentrations ranged from 0.04387 ng/kg to 0.52075 ng/kg, which are less than its residential RSL.

- Twenty-eight VOCs were detected in the soil samples collected at Parco Eva. Acetone and toluene were the most frequently detected VOCs in soil sample. Acetone was detected in 10 samples at estimated concentrations ranging from 0.00835 mg/kg to 0.104 mg/kg. Toluene was detected in nine samples at estimated concentrations ranging from 0.00113 mg/kg to 0.0138 mg/kg. The remaining

VOCs were detected in five or less samples. The concentrations of all VOCs were less than their residential RSLs.

- Naphthalene was the only SVOC detected in soil samples from Parco Eva. Naphthalene was detected in only one sample at an estimated concentration of 0.00733 mg/kg, which is less than its residential RSL.

- No pesticides or PCBs were detected in the soil samples from Parco Eva.

- Inorganics were detected frequently in soil samples. Concentrations of arsenic exceeded its residential RSL in all 12 samples.

In summary, concentrations of dioxins/furans, VOCs, and SVOCs were less than their residential RSLs and pesticides and PCBs were not detected in any soil samples from Parco Eva. Arsenic (12 samples) was the only chemical detected in soil at Parco Eva at concentrations exceeding its residential RSL.

4.2.3 Parco Le Ginestre

Table 4-21 presents the chemicals that were detected in the 11 soil samples collected from Parco Le Ginestre. Descriptive statistics are presented in Table 4-22.

- Dioxins/furans were frequently detected in all soil samples. The TEQ concentrations ranged from 0.0294 ng/kg to 2.8857 ng/kg, which is less than its residential RSL.

- Thirty VOCs were detected in the soil samples collected at Parco Le Ginestre. VOCs were detected frequently in soil samples. Toluene, acetone, ethylbenzene, sec-butylbenzene, 4-isopropyltoluene, and n-propylbenzene were the most frequently detected VOCs. Toluene was detected in 11 samples at estimated concentrations ranging from 0.000703 mg/kg to 0.014 mg/kg. Acetone was detected in nine samples at estimated concentrations ranging from 0.00841 mg/kg to 0.0478 mg/kg. Ethylbenzene was detected in nine samples at estimated concentrations ranging from 0.00048 mg/kg to 0.00597 mg/kg. sec-Butylbenzene was detected in nine samples at estimated concentrations ranging from 0.000318 mg/kg to 0.00472 mg/kg. 4-Isopropyltoluene was detected in eight samples at estimated concentrations ranging from 0.000531 mg/kg to 0.00514 mg/kg. n-Propylbenzene was detected in eight samples at estimated concentrations ranging from 0.000435 mg/kg to 0.00622 mg/kg. The concentrations of all VOCs were less than the residential RSLs.

- 2-Chloronaphthalene (0.0105 mg/kg), 2-methylnaphthalene (0.0244 mg/kg), hexachloroethane (0.0145 mg/kg), naphthalene (0.00899 mg/kg), and phenol (0.0473 mg/kg) were the only SVOCs detected in soil samples and were only detected in one sample. The estimated concentrations of all SVOCs were less than their residential RSLs.

- No pesticides or PCBs were detected in the soil samples from Parco Le Ginestre.

- Inorganics were detected frequently in soil samples with the exception of mercury which was only detected in two samples. Most inorganics were detected in all 11 soil samples collected from Parco Le Ginestre. Concentrations of arsenic exceeded its residential RSL in all 11 samples.

In summary, concentrations of dioxins/furans, VOCs, and SVOCs were less than their residential RSLs and pesticides and PCBs were not detected in any soil samples from Parco Le Ginestre. Arsenic (11 samples) was the only chemical detected in soil from Parco Le Ginestre at concentrations exceeding its residential RSL.

4.2.4 NAVFAC-Leased Homes

Table 4-23 presents the chemicals that were detected in the six soil samples collected from the NAVFAC-leased homes. Descriptive statistics are presented in Table 4-24.

- Dioxins/furans were frequently detected in all soil samples. The TEQ concentrations ranged from 0.0986 ng/kg to 1.25231 ng/kg, which are less than its residential RSL.

- Eight VOCs were detected in the soil samples collected at the NAVFAC-leased homes. Benzene and toluene were detected in all six soil samples. 2-Butanone, acetone, and o-xylene were the most frequently detected VOCs. 2-Butanone was detected in five samples at estimated concentrations ranging from 0.00353 mg/kg to 0.00869 mg/kg. Acetone was detected in five samples at concentrations ranging from 0.0519 mg/kg to 0.0941 mg/kg. o-Xylene was detected in three samples at estimated concentrations ranging from 0.000223 mg/kg to 0.00041 mg/kg. The remaining VOCs were only detected in one sample. The concentrations of all VOCs were less than their residential RSLs.

- Eighteen SVOCs were detected in the soil samples. With the exception of bis(2-ethylhexyl)phthalate, SVOCs were detected infrequently in soil sample. Bis(2-ethylhexyl)phthalate was detected in 4 samples at estimated concentrations ranging from 0.127 mg/kg to 0.266 mg/kg. The remaining

SVOCs were detected in one sample. Concentrations of carcinogenic PAHs exceeded its residential RSL in one sample.

- No pesticides or PCBs were detected in any of the soil samples from the NAVFAC-leased homes.

- Inorganics were detected frequently in soil samples with most inorganics being detected in all six soil samples collected at the NAVFAC-leased homes. Concentrations of arsenic exceeded its residential RSL in all six samples.

In summary, concentrations of dioxins/furans and VOCs were less than their residential RSLs and pesticides and PCBs were not detected in any soil samples from the NAVFAC-leased homes. Concentrations of carcinogenic PAHs (one sample) and arsenic (6 samples) exceeded its residential RSL in soil samples collected from the NAVFAC-leased homes.

4.3 GOVERNMENT-BASED PROPERTIES

4.3.1 Gricignano Support Site

Table 4-25 presents the chemicals that were detected in the 10 soil samples collected from the Gricignano Support Site. Descriptive statistics are presented in Table 4-26.

- Dioxins/furans were frequently detected in all soil samples. The TEQ concentrations ranged from 0.0587 ng/kg to 0.6465 ng/kg, which are less than its residential RSL.

- Four VOCs were detected in the soil samples collected at the Gricignano Support Site. Toluene was detected in nine samples at estimated concentrations ranging from 0.000847 mg/kg to 0.0164 mg/kg. 1,1,2-Trichlorotrifluorethane was detected in eight samples at estimated concentrations ranging from 0.00163 mg/kg and 0.0117 mg/kg. Chloroform was detected in two samples at estimated concentrations of 0.00114 mg/kg and 0.00168 mg/kg. 2-Butanone was detected in one sample at an estimated concentration of 0.00342 mg/kg. The concentrations of all VOCs were less than their residential RSLs.

- Eighteen SVOCs were detected in the soil samples at the Gricignano Support Site. SVOCs were detected infrequently in the soil samples. Chrysene (0.026 mg/kg and 0.313 mg/kg), fluoranthene (0.032 mg/kg and 0.735 mg/kg), and pyrene (0.026 mg/kg and 0.614 mg/kg) were detected in two samples. The remaining SVOCs were detected in one sample. Concentrations of carcinogenic PAHs exceeded its residential RSL in one sample.

- No pesticides or PCBs were detected in any of the soil samples from the Gricignano Support Site.

- Inorganics were detected frequently in soil samples with most inorganics being detected in all 10 soil samples collected at the Gricignano Support Site. Concentrations of arsenic exceeded its residential RSL in all 10 samples.

In summary, concentrations of dioxins/furans and VOCs were less than their residential RSLs and pesticides and PCBs were not detected in any soil samples. Concentrations of carcinogenic PAHs (one sample) and arsenic (10 samples) exceeded their residential RSLs in soil samples collected from the Gricignano Support Site. Figure 4-4 shows the locations of the carcinogenic PAHs RSL exceedances.

4.3.2 Capodichino

Table 4-27 presents the chemicals that were detected in the 10 soil samples collected from the Capodichino. Descriptive statistics are presented in Table 4-28.

- Dioxins/furans were frequently detected in all soil samples. The TEQ concentrations ranged from 0.06305 ng/kg to 1.3046 ng/kg, which are less than its residential RSL.

- Four VOCs were detected in the soil samples collected from Capodichino. 1,1,2-Trichlorotrifluorethane was detected in eight samples at estimated concentrations ranging from 0.00155 mg/kg to 0.00629 mg/kg. Toluene was detected in seven samples at concentrations of 0.000778 mg/kg to 0.0189 mg/kg. Chloroform was detected in four samples at concentrations of 0.0106 mg/kg to 0.0273 mg/kg. 1,4-Dichlorobenzene was detected in one sample at an estimated concentration of 0.00013 mg/kg. The concentrations of all VOCs were less than their residential RSLs.

- Nineteen SVOCs were detected in the soil samples from Capodichino. Bis(2-ethylhexyl)phthalate was the most frequently detected SVOC, being detected in six samples at estimated concentrations ranging from 0.0885 mg/kg to 0.206 mg/kg. Fluoranthene was detected in four samples at estimated concentrations ranging from 0.0252 mg/kg to 0.29 mg/kg. Pyrene was detected in four samples at estimated concentrations ranging from 0.0252 mg/kg to 0.23 mg/kg. The remaining SVOCs were detected in three or less samples. Concentrations of carcinogenic PAHs exceeded its residential RSL in two samples.

- 4,4'-DDT was the only pesticide detected in soil samples and was only detected in one sample at a concentration of 0.00304 mg/kg. The detected concentration of 4,4'-DDT was less than its residential RSL.

- No PCBs were detected in any of the soil samples from Capodichino.

- Inorganics were detected frequently in soil samples with most inorganics being detected in all 10 soil samples collected from Capodichino. Concentrations of arsenic exceeded its residential RSL in all 10 samples.

In summary, concentrations of dioxins/furans, VOCs, and pesticides were less than the screening levels and PCBs were not detected in any soil samples from Capodichino. Concentrations of carcinogenic PAHs (two samples) and arsenic (10 samples) exceeded their residential RSLs in soil samples collected from Capodichino. Figure 4-5 shows the locations of the carcinogenic PAHs RSL exceedances.

4.3.3 Lago Patria Receiver Site

No soil samples were collected at the Lago Patria Receiver Site because the site is completely covered with pavement.

4.3.4 Carney Park

Table 4-29 presents the chemicals that were detected in the 10 soil samples collected from Carney Park. Descriptive statistics are presented in Table 4-30.

- Dioxins/furans were frequently detected in all soil samples. The TEQ concentrations ranged from 0.2868 ng/kg to 0.70399 ng/kg, which are less than its residential RSL.

- Five VOCs were detected in the soil samples collected at Carney Park. 1,1,2-Trichlorotrifluorethane and toluene were the most frequently detected VOCs. 1,1,2-Trichlorotrifluorethane was detected in seven samples at estimated concentrations ranging from 0.00295 mg/kg to 0.0647 mg/kg. Toluene was detected in six samples at estimated concentrations ranging from 0.00193 mg/kg to 0.0184 mg/kg. The remaining VOCs were detected in three or less samples. The concentrations of all VOCs were less than their residential RSLs.

- Eight SVOCs were detected in the soil samples at Carney Park. Bis(2-ethylhexyl)phthalate was the most frequently detected SVOC being detected in eight samples at estimated concentrations ranging from 0.131 mg/kg 1.03 mg/kg. Di-n-butyl phthalate was detected in three samples at estimated

concentrations ranging from 0.043225 mg/kg to 0.068 mg/kg. The remaining SVOCs were detected in three or less samples. Concentrations of carcinogenic PAHs exceeded its residential RSL in one sample.

- No pesticides or PCBs were detected in any of the soil samples from Carney Park.

- Inorganics were detected frequently in soil samples with most inorganics being detected in all 10 soil samples collected from Carney Park. Concentrations of arsenic exceeded its residential RSL in all 10 samples.

In summary, concentrations of dioxins/furans and VOCs were less than their residential RSLs and pesticides and PCBs were not detected in any soil samples from Carney Park. Concentrations of carcinogenic PAHs (one sample) and arsenic (10 samples) exceeded their residential RSLs in soil samples collected from Carney Park. Figure 4-6 shows the locations of the carcinogenic PAHs RSL exceedances.

4.3.5 JFC NATO Site

Table 4-31 presents the chemicals that were detected in the nine soil samples collected from the JFC NATO Site. Descriptive statistics are presented in Table 4-32.

- Dioxins/furans were frequently detected in all soil samples. The TEQ concentrations ranged from 0.6566 ng/kg to 13.2458 ng/kg and exceeded the screening criteria in three samples.

- Four VOCs were detected in the soil samples collected from the JFC NATO Site. Acetone was detected in three samples at estimated concentrations ranging from 0.00638 mg/kg to 0.0176 mg/kg. Toluene was detected in three samples at estimated concentrations ranging from 0.00245 mg/kg to 0.00358 mg/kg. 2-Butanone (0.00288 mg/kg) and styrene (0.000341 mg/kg) were detected in one sample. The concentrations of all VOCs were less than their residential RSLs.

- Sixteen SVOCs were detected in the soil samples at the JFC NATO Site. SVOCs were detected frequently in soil samples. Chrysene and fluoranthene were the most frequently detected SVOCs being detected in eight samples. Benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, and pyrene were detected in seven samples. Benzo(a)anthracene was detected in six samples and benzo(g,h,i)perylene was detected in five samples. Concentrations of carcinogenic PAHs exceeded its residential RSL in seven samples.

- No pesticides were detected in any of the soil samples from the JFC NATO Site.

- Aroclor-1260 was the only PCB detected in soil samples from the JFC NATO Site. Aroclor-1260 was detected in six samples at estimated concentrations ranging from 0.00798 mg/kg to 0.167 mg/kg. The detected concentrations of Aroclor-1260 were less than its residential RSL.

- Inorganics were detected frequently in soil samples with most inorganics being detected in all nine soil samples collected from the JFC NATO Site. Concentrations of arsenic exceeded its residential RSL in all nine samples.

In summary, concentrations of VOCs, pesticides, and PCBs were less than their residential RSLs. Concentrations of dioxins/furans (three samples), carcinogenic PAHs (seven samples), and arsenic (nine samples) exceeded their residential RSLs in soil samples collected from the JFC NATO Site. Figure 4-7 shows the locations of the carcinogenic PAHs and TEQ RSL exceedances.

4.3.6 U.S. Consulate

Table 4-33 presents the chemicals that were detected in the one soil sample collected from the U.S. Consulate. Descriptive statistics are presented in Table 4-34.

- The TEQ concentration was 5.869 ng/kg, which exceeded its residential RSL.

- No VOCs were detected in soil samples collected at the U.S. Consulate.

- Twenty-one SVOCs were detected in soil samples collected from the U.S. Consulate. Carcinogenic PAHs were detected at a concentration which exceeded its residential RSL.

- 4,4'-DDE, 4,4'-DDT, endosulfan sulfate, endrin, and gamma-chlordane were the only pesticides detected in soil at the U.S. Consulate. The detected concentrations of all pesticides were less than their residential RSLs.

- No PCBs were detected in the one soil sample collected from the U.S. Consulate.

- Arsenic was the only inorganic which was detected at a concentration exceeding its residential RSL.

In summary, concentrations of dioxins/furans and VOCs were less than their residential RSLs at the U.S. Consulate and VOCs and PCBs were not detected. Dioxins/furans, carcinogenic PAHs, and arsenic were detected at concentrations greater than residential RSLs in soil from the U.S. Consulate.

4.4 BACKGROUND EVALUATION

Arsenic, carcinogenic PAHs, and dioxins/furans were the only constituents that were detected in soil samples collected during the Phase I ETSA at concentrations greater than their residential RSLs. The presence of these constituents could be attributed to naturally occurring or anthropogenic background conditions. To determine whether these constituents were attributable to background, various statistical techniques were applied to the data, as outlined in "Procedural Guidance for Statistically Analyzing Environmental Background Data" (U.S. Navy, 1998). The results of the statistical analysis are presented in Appendix C.

Arsenic

Arsenic was detected in all soil samples at concentrations ranging from 4.6 mg/kg to 21 mg/kg. The mean and median concentrations are approximately equal at values of 12 mg/kg. The data approximate a normal distribution. The histogram and boxplot (Figure 4-8) illustrate that the data are roughly symmetrical. Moreover, the normal probability plot (Figure 4-8) is roughly linear. The presence of contamination would show a deviation in the data as presented in the histogram, boxplot, and normal plot. For arsenic, there are no apparent deviations or extreme concentrations on any of these plots. The soil data collected in this investigation are consistent with background data summarized in Cicchella et al. (2005), which reported naturally occurring soil arsenic concentrations up to 60 mg/kg due to geothermal activities in the Neapolitan volcanic fields.

Arsenic concentrations were also compared by study area. The median arsenic concentrations by study area ranged from 9.2 mg/kg to 14.75 mg/kg. The maximum arsenic concentrations ranged from 12 mg/kg to 21 mg/kg. Boxplots from each area (Figure 4-9) illustrate that the arsenic concentrations in each study area are similar.

Carcinogenic PAHs (BaPEq)

Carcinogenic PAHs, expressed in terms of benzo[a]pyrene equivalents (BaPEq) were detected in 17.3 percent of all samples collected during the Phase I ETSA. Concentrations ranged from 0.0065 ug/kg to 492 ug/kg. The median concentration is 20.9 ug/kg and the mean concentration is 26.86 ug/kg. From the histogram of all the concentrations (Figure 4-10) it can be seen that the majority of the data ranges from 0 to 50 ug/kg. From the normal probability plot and boxplot it can be seen that there are seven

extreme concentrations that are separated from the remainder of the data. These concentrations are greater than 47.3 ug/kg. This separation of the concentrations indicates that the data may be from two populations. Therefore, BaPEq concentrations less than or equal to 47.3 ug/kg could be considered background concentrations. PAHs are ubiquitous in soil and background concentrations of benzo[a]pyrene in urban soil in the United States have been documented as ranging from 165 to 200 ug/kg (ATSDR 1995). The data shows that concentrations are clearly within this documented range.

BaPEq concentrations were also compared by study area. The median concentrations by study area ranged from 10.2 ug/kg to 11.6 ug/kg and maximum concentrations ranged from 0.0116 mg/kg to 0.9846 mg/kg. Boxplots from each area (Figure 4-11) illustrate that the BaPEq concentrations in each study area are similar.

2,3,7,8-TCDD TEQ

Dioxins/furans, expressed in terms of TEQ were detected in 99.5 percent of the soil samples collected during this Phase I ETSA at concentrations ranging from 0.00135 ng/kg to 16.14 ng/kg with a median concentration of 0.5 ng/kg and a mean concentration of 1.1 ng/kg. The histogram shows that a majority of the data is within a range of 0 to 5 ng/kg. The normal probability plot and the boxplot suggest that the six highest concentrations (greater than or equal to 5.4 ng/kg) deviate from the remainder of the data (Figure 4-12). Therefore, concentrations less than or equal to 5 ng/kg could be considered background in the investigation area. Dioxins/furans are ubiquitous in soil and are typically found at low background levels, such as in the part per trillion levels (ATDSR, 1998). This is consistent with concentrations detected during this investigation. Boxplots from each area (Figure 4-13) illustrate the TEQ concentrations in each study area are similar.

4.5 SUMMARY OF SOIL DATA

Arsenic was detected in all Phase I ETSA samples at levels greater than the residential soil RSL. However, the levels that were detected across the region can be attributed to the volcanic soil and are consistent with concentrations that have been reported in the literature. Carcinogenic PAHs, expressed in terms of BaPEq, and dioxins, expressed in terms of TEQ, are the only other constituents that were detected in soil at concentrations greater than residential soil RSLs. Concentrations of carcinogenic PAHs and dioxins are consistent with anthropogenic background levels typically seen in urban soils, with the exception of a limited number of samples. Table 4-35 summarizes the exceedances by sampling area across the region.

5.0 TAP WATER SAMPLING

Tap water samples were collected concurrently with soil samples from 130 residences on the economy throughout the Naples area of Campania, with samples assigned to nine study areas (Table 1-1). The study areas were defined by the locations of the air monitoring stations. The boundaries of the nine study areas are illustrated in Figure 1-13. Additionally, tap water samples were collected from 30 residences within the government-leased Parcos, six NAVFAC-leased homes, and government-based properties (Table 1-6). The tap water samples were analyzed for VOCs, SVOCs, dioxins/furans, pesticides, PCBs, and metals, consistent with what was analyzed for in soil samples. Tap water samples were also analyzed for radiological parameters (only gross alpha, gross beta, and total uranium), anions, cyanide, and bacteriological parameters (total coliform, fecal coliform, fecal streptococcus, and agar colony count). The complete set of tap water data can be found in Appendix D.

The data were compared to residential tap water RSLs and U.S. EPA MCLs, where applicable. In addition, the data were compared to the inhalation-only tap water RSL, 10 times the noncarcinogenic RSL, and 100 times the carcinogenic RSL. The RSLs correspond to a cancer risk of 1×10^{-6} and a hazard index of 1.0 for carcinogens and noncarcinogens, respectively.

Multiples of the RSLs are being used as screening concentrations to determine if residents need to be immediately notified that specific chemicals are detected in their water representing some unacceptable health risk. The following criteria were defined for this Phase I activity as warranting this tenant immediate notification action:

- If a chemical is identified as a developmental, teratogenic, or mutagenic chemical, as identified on Table 5-1 and the concentration exceeds its RSL

- If the concentration of a chemical other than those identified in Table 5-1 is greater than 10 times it noncarcinogenic RSL, 100 times its carcinogenic RSL, or greater than its MCL

- If a chemical concentration in tap water is greater than 10 times its carcinogenic inhalation RSL or greater than its noncarcinogenic inhalation RSL, then a mitigation action is warranted.

The presence of total coliform, fecal coliform, or fecal streptococcus in a tap water sample also warranted immediate notification of the resident to take precautions regarding the use of their tap water (e.g., using bottled water, boiling water before use) and the collection of another tap water sample. If the resample indicated the presence of any of these parameters, the resident was notified to continue using precautionary measures until mitigation measures were executed, and no further sampling would be

performed. If the resample indicated an absence of these parameters, a third "tie-breaker" tap water sample was collected. If the "tie-breaker" resample indicated the presence of any of these parameters, the resident was notified to continue using bottled water until some mitigation activity could be executed. If the "tie-breaker" resample indicated an absence of these parameters, then no further action was warranted for the tap water. The bacteriological results summarized in this report only reflect the final sample collected for each residence.

Most drinking water sources have very low levels of radioactive contaminants, most of which are naturally occurring. Most radioactive contaminants are at levels that are low enough to not be considered a public health concern. During the Pilot and Phase I studies, tap water samples were only evaluated for gross alpha and gross beta radioactivity. To protect public health, the EPA has established drinking water standards for several types of radioactive contaminants, including alpha and beta-emitters. The gross alpha MCL is 15 picocuries per L (pCi/L) and the gross beta MCL is 4 millirem per year (mrem/yr). The gross alpha MCL is a concentration, but the gross beta MCL is a dose. Because a dose cannot be measured directly, a screening concentration of 50 pCi/L was used. This is a commonly accepted screening value that represents contributions from multiple radionuclides. Tap water sample results for radioactivity were compared to the MCL of 15 pCi/L for gross alpha and the representative screening value of 50 pCi/L for gross beta.

Summaries of the tap water data, separated by Study Area, Parco, and government-based property, follow. Within each area, the tap water data are separated by water source; some houses received their water from a municipal water supply and some houses receive their water from wells or unknown sources. When sampling was conducted, samplers searched for water meters, well heads, and holding tanks or used results of chlorine tests to better identify the source of the tap water. For those locations identified as having municipal water as their water supply, at best the identification is what the landlord may portray as the municipal water supply.

5.1 ECONOMY HOUSES

5.1.1 Study Area 1

This section presents results for tap water samples collected from houses that received their water from a municipal water supply and from houses that received water from private wells or unknown sources in Study Area 1.

5.1.1.1 Study Area 1 – Houses Supplied by Municipal Water

Table 5-2 presents the chemicals that were detected in 17 tap water samples collected from dwellings that received their water from a municipal water supply at Study Area 1. Descriptive statistics are presented in Table 5-3. VOCs, dioxins/furans, inorganics, chloride, nitrate, sulfate, and one microbiological parameter were frequently detected in the municipal tap water samples.

- Ten VOCs were detected in the 17 tap water samples collected from houses supplied by municipal water at Study Area 1. VOCs were detected infrequently in the tap water samples with the exception of bromodichloromethane, bromoform, chlorodibromomethane, and chloroform. The chemicals are trihalomethanes, disinfectant by-products associated with water treatment. Chlorodibromomethane was detected in 15 samples at estimated concentrations ranging from 0.201 ug/L to 1.16 ug/L and the concentrations of chlorodibromomethane exceeded the tap water RSL in five samples but were less than the MCL in all samples. Chloroform was detected in 10 samples at estimated concentrations ranging from 0.0931 ug/L to 0.276 ug/L. The concentrations of chloroform exceeded the tap water RSL in three samples and the inhalation RSL in two samples, but were less than the MCL in all samples. The concentrations of bromodichloromethane and bromoform were less than RSLs and MCLs in all samples. PCE was detected in 4 of 17 samples (0.197 ug/L to 0.217 ug/L) and the concentrations of PCE exceeded the RSL in four samples. Figure 5-1 shows the locations of the VOC exceedances.

- Dioxins/furans were reported in 15 of 17 municipal water samples in Study Area 1. The TEQ concentrations ranged from 0.000012 ng/L to 0.000721 ng/L and exceeded the tap water RSL in one sample. The TEQ concentrations were less than the MCL in all samples. Figure 5-2 shows the location of the dioxin/furan exceedance.

- One SVOC (di-n-octylphthalate) was detected in two tap water samples at concentrations less than the RSL.

- No pesticides or PCBs were detected in the municipal tap water samples collected from Study Area 1.

- Inorganics were detected frequently in the municipal tap water samples. The concentrations of arsenic exceeded the tap water RSL in all 17 samples and were greater than 100 times the carcinogenic RSL in 3 samples. Concentrations of arsenic were less than the MCL in all samples. The concentrations of the other inorganics were less than RSLs and MCLs in all samples.

- Chloride, nitrate, and sulfate were frequently detected in the municipal tap water samples in Study Area 1. Fluoride and nitrite were detected infrequently. The concentrations of these parameters were less than the tap water RSLs and MCLs in all samples.

- Gross alpha radioactivity was reported in four samples and gross beta was detected in six samples. The concentrations of gross alpha and gross beta radioactivity were less than the MCLs in all samples.

- One microbiological parameter (plate count) was reported in 13 of 17 municipal tap water samples. The plate counts were less than the MCL in all samples.

In summary, concentrations of VOCs (5 samples), dioxins/fruans (1 sample), and arsenic (17 samples) exceeded RSLs in the municipal tap water samples collected from Study Area 1.

5.1.1.2 Study Area 1 – Houses Supplied by Wells or Unknown Sources

Table 5-4 presents the chemicals that were detected in three tap water samples collected from dwellings that received their water from wells or unknown sources in Study Area 1. Descriptive statistics are presented in Table 5-5. VOCs, dioxins/furans, inorganics, chloride, nitrate, sulfate, and one microbiological parameter were frequently detected in the tap water samples.

Seven VOCs were detected in the three tap water samples collected from houses supplied by wells or unknown sources. Bromodichloromethane, bromoform, and chlorodibromomethane were detected in all three samples. These chemicals are trihalomethanes, disinfectant byproducts associated with water treatment. The concentrations of chlorodibromomethane exceeded the tap water RSL in one sample but were less than the MCL in all samples. The concentrations of bromodichloromethane and bromoform were less than RSLs and MCLs in all samples. Chloroform was detected in two samples and the concentration of chloroform in one sample exceeded the tap water RSL and the inhalation RSL but were less than the MCL in all samples. PCE was detected in one sample at a concentration (0.222 ug/L) that exceeded the tap water RSL but was less than the MCL. Figure 5-1 shows the location of the PCE exceedance.

- Dioxins/furans were reported in all three samples. The TEQ concentrations were less than the tap water RSL and MCL in all samples.

- No SVOCs were detected in the three tap water samples collected from houses supplied by wells or unknown sources in Study Area 1.

- No pesticides or PCBs were detected in tap water samples collected from houses supplied by wells or unknown sources in Study Area 1.

- Inorganics were detected frequently in the three samples. The concentrations of arsenic exceeded the tap water RSL in all three samples but were less than the MCL in all samples. The concentrations of the other inorganics were less than RSLs and MCLs in all samples.

- Chloride, nitrate, and sulfate were detected in the three tap water samples. Fluoride was detected in one sample. The concentrations of these parameters were less than the tap water RSLs and MCLs in all samples.

- No radiological parameters were detected in tap water samples collected from houses supplied by wells or unknown sources in Study Area 1.

- One microbiological parameter (plate count) was reported in all three tap water samples. The plate counts were less than the MCL in all samples.

In summary, concentrations of VOCs in one sample and arsenic in all three samples exceeded RSLs in tap water samples collected from houses supplied by wells or unknown sources in Study Area 1.

5.1.2 Study Area 2

Table 5-6 presents the chemicals that were detected in eight tap water samples collected from dwellings that received their water from a municipal water supply at Study Area 2. Descriptive statistics are presented in Table 5-7. VOCs, dioxins/furans, inorganics, chloride, fluoride, nitrate, sulfate, radiological parameters, and one microbiological parameter were frequently detected in the municipal tap water samples.

- Eleven VOCs were detected in the eight tap water samples collected from houses supplied by municipal water at Study Area 2. Most of the VOCs were detected frequently in the municipal tap water samples with the exception of acetone, 1,1-dichloroethane, and 1,1,1-trichloroethane. Of the VOCs detected in the eight samples, only the concentrations of PCE, chloroform, and chlorodibromomethane exceeded the tap water RSLs. PCE was detected in seven samples at estimated concentrations ranging from 0.229 ug/L to 0.468 ug/L and exceeded the tap water RSL in all seven samples. The PCE concentrations were less than the MCL in all samples. Chloroform was detected in all eight samples at estimated concentrations ranging from 0.151 ug/L to 0.261 ug/L. The concentrations of chloroform exceeded the tap water RSL in five samples and the inhalation RSL in

four samples, but were less than the MCL in all samples. Chlorodibromomethane was detected in all eight samples (0.52 ug/L to 1.02 ug/L) and the concentrations of chlorodibromomethane exceeded the RSL in three samples but were less than the MCL. Figure 5-3 shows the locations of the PCE exceedances.

- Dioxins/furans were reported in 6 of 8 municipal water samples in Study Area 2. The TEQ concentrations ranged from 0.000004 ng/L to 0.000559 ng/L and exceeded the tap water RSL in one sample. The TEQ concentrations were less than the MCL in all samples. Figure 5-4 shows the location of the dioxin/furan exceedance.

- One SVOC (di-n-octylphthalate) was detected in one tap water sample at a concentration less than the RSL.

- No pesticides or PCBs were detected in the municipal tap water samples collected from Study Area 2.

- Inorganics were detected frequently in the municipal tap water samples. The concentrations of arsenic exceeded the tap water RSL in all eight samples and were greater than 100 times the carcinogenic RSL in three samples. Concentrations of arsenic were less than the MCL in all samples. The concentrations of the other inorganics were less than RSLs and MCLs in all samples.

- Chloride, fluoride, nitrate, and sulfate were frequently detected in the municipal tap water samples in Study Area 2. The concentrations of these parameters were less than the tap water RSLs and MCLs in all samples.

- Gross alpha radioactivity was reported in five samples and gross beta was detected in seven samples. The concentrations of gross alpha and gross beta radioactivity were less than the MCLs in all samples.

- One microbiological parameter (plate count) was reported in 7 of 8 municipal tap water samples. The plate counts were less than the MCL in all samples.

In summary, concentrations of VOCs (7 samples), dioxins/furans (1 sample), and arsenic (8 samples) exceeded RSLs in the municipal tap water samples collected from Study Area 2.

5.1.3 Study Area 3

Table 5-8 presents the chemicals that were detected in five tap water samples collected from dwellings that received their water from a municipal water supply in Study Area 3. Descriptive statistics are presented in Table 5-9. VOCs, dioxins/furans, inorganics, chloride, nitrate, sulfate, radiological parameters, and one microbiological parameter were frequently detected in the municipal tap water samples.

- Ten VOCs were detected in the five tap water samples collected from houses supplied by municipal water at Study Area 3. Most of the VOCs were detected infrequently in the municipal tap water samples with the exception of bromodichloromethane, bromoform, and chlorodibromomethane. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment. Of the VOCs detected in the samples, only the concentrations of PCE, chloroform, and chlorodibromomethane exceeded the tap water RSLs. PCE was detected in one sample at an estimated concentration of 0.321 ug/L which exceeds the tap water RSL but is less than the MCL. Chloroform was detected in two samples at concentrations ranging from 0.214 J ug/L to 3.95 ug/L. The concentrations of chloroform in the two samples exceeded the tap water RSL and the inhalation RSL but were less than the MCL. The maximum chloroform concentration was ten times greater than the inhalation RSL. Chlorodibromomethane was detected in four samples (0.557 ug/L to 1.14 ug/L). The concentration of chlorodibromomethane in one sample exceeded the RSL but was less than the MCL. Figure 5-5 shows the locations of the PCE exceedances.

- Dioxins/furans were reported in all five municipal water samples in Study Area 3. The 2,3,7,8-TCDD TEQs were less than the tap water RSL and the MCL in all samples.

- No SVOCs were detected in the tap water samples collected in Study Area 3.

- No pesticides or PCBs were detected in the tap water samples collected in Study Area 3.

- Inorganics were detected frequently in the municipal tap water samples. The concentrations of arsenic exceeded the tap water RSL in all five samples but were less than the MCL in all samples. The concentrations of the other inorganics were less than RSLs and MCLs in all samples.

- Chloride, nitrate, and sulfate were frequently detected in the municipal tap water samples in Study Area 3. The concentrations of these parameters were less than the tap water RSLs and MCLs in all samples.

- Gross alpha and gross beta radioactivity were reported in four samples. The concentrations of these radioactive parameters were less than the MCLs in the samples.

- One microbiological parameter (plate count) was reported in 4 of 5 municipal tap water samples. The plate counts were less than the MCL in the samples.

In summary, concentrations of VOCs (2 samples) and arsenic (5 samples) exceeded RSLs in the municipal tap water samples collected from Study Area 3.

5.1.4 Study Area 4

Table 5-10 presents the chemicals that were detected in three tap water samples collected from dwellings that received their water from a municipal water supply in Study Area 4. Descriptive statistics are presented in Table 5-11. VOCs, dioxins/furans, inorganics, chloride, nitrate, sulfate, and one microbiological parameter were frequently detected in the municipal tap water samples.

- Four VOCs were detected in the three tap water samples collected from houses supplied by municipal water at Study Area 4. Most of the VOCs were detected frequently in the municipal tap water samples with the exception of chloroform. Of the VOCs detected in the three samples, only the concentration of chlorodibromomethane exceeded the tap water RSL. Chlorodibromomethane was detected in two samples (0.55 ug/L to 1.24 ug/L). The concentration of chlorodibromomethane in one sample exceeded the RSL but was less than the MCL. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment.

- Dioxins/furans were reported in the three municipal tap water samples in Study Area 4. The TEQ concentrations were less than the tap water RSL and the MCL in all samples.

- No SVOCs were detected in the tap water samples collected from Study Area 4.

- No pesticides or PCBs were detected in the tap water samples collected from Study Area 4.

- Inorganics were detected frequently in the municipal tap water samples. The concentrations of arsenic exceeded the tap water RSL in the three samples but were less than the MCL. The concentrations of the other inorganics were less than RSLs and MCLs in all samples.

- Chloride, nitrate, and sulfate were detected in the three municipal tap water samples collected from Study Area 4. The concentrations of these parameters were less than the tap water RSLs and MCLs in all samples.

- Gross alpha and gross beta radioactivity were reported in one sample and the concentrations of these radioactive parameters were less than the MCLs in the sample.

- One microbiological parameter (plate count) was reported in all three municipal tap water samples. The plate counts were less than the MCL in the samples.

In summary, concentrations of VOCs (1 sample) and arsenic (3 samples) exceeded RSLs in the municipal tap water samples collected from Study Area 4.

5.1.5 Study Area 5

This section presents results for tap water samples collected from houses that received their water from a municipal water supply and from houses that received water from private wells or unknown sources in Study Area 5.

5.1.5.1 Study Area 5 – Houses Supplied by Municipal Water

Table 5-12 presents the chemicals that were detected in 26 tap water samples collected from dwellings that received their water from a municipal water supply at Study Area 5. Descriptive statistics are presented in Table 5-13. VOCs, dioxins/furans, inorganics, chloride, nitrate, sulfate, and one microbiological parameter were frequently detected in the municipal tap water samples.

- Ten VOCs were detected in the 26 tap water samples collected from houses supplied by municipal water at Study Area 5. VOCs were detected infrequently in the tap water samples with the exception of bromodichloromethane, bromoform, chlorodibromomethane, and chloroform. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment. Of the VOCs detected in the samples, only the concentrations of chloroform and chlorodibromomethane exceeded the tap water RSLs. Chlorodibromomethane was detected in 23 samples at estimated concentrations ranging from 0.168 ug/L to 0.958 ug/L. The concentrations of chlorodibromomethane exceeded the tap water RSL in two samples but were less than the MCL in all samples. Chloroform was detected in nine samples at estimated concentrations ranging from 0.0921 ug/L to 0.245 ug/L. The concentrations of chloroform exceeded the tap water RSL and the inhalation RSL in one sample but were less than the MCL in all samples.

- Dioxins/furans were reported in 19 of 26 municipal water samples in Study Area 5. The TEQ concentrations ranged from 0.000013 ng/L to 0.001525 ng/L and exceeded the tap water RSL in two samples. The TEQ concentrations were less than the MCL in all samples. Figure 5-6 shows the locations of the dioxin/furan exceedances.

- Two SVOCs (butyl benzyl phthalate and di-n-octylphthalate) were detected in two tap water samples at concentrations less than the RSLs.

- No pesticides or PCBs were detected in the municipal tap water samples collected in Study Area 5.

- Inorganics were detected frequently in the municipal tap water samples. The concentrations of arsenic exceeded the tap water RSL in all 26 samples and were greater than 100 times the carcinogenic RSL in one sample. Concentrations of arsenic were less than the MCL in all samples. The concentrations of the other inorganics were less than RSLs and MCLs in all samples.

- Chloride, nitrate, and sulfate were frequently detected in the municipal tap water samples in Study Area 5. The concentrations of these parameters were less than the tap water RSLs and MCLs in all samples.

- Gross alpha radioactivity was reported in five samples and gross beta was detected in four samples. The concentrations of gross alpha and gross beta radioactivity were less than the MCLs in all samples.

- One microbiological parameter (plate count) was reported in 23 of 26 municipal tap water samples. The plate counts were less than the MCL in all samples.

In summary, concentrations of VOCs (2 samples), dioxins/furans (2 samples), and arsenic (26 samples) exceeded RSLs in the municipal tap water samples collected from Study Area 5.

5.1.5.2 Study Area 5 – Houses Supplied by Wells or Unknown Sources

Table 5-14 presents the chemicals that were detected in four tap water samples collected from dwellings that received their water from wells or unknown sources at Study Area 5. Descriptive statistics are presented in Table 5-15. VOCs, dioxins/furans, inorganics, chloride, fluoride, nitrate, sulfate, radiological parameters, and microbiological parameters were frequently detected in the tap water samples.

- Four VOCs (bromodichloromethane, bromoform, chlorodibromomethane, and chloroform) were detected in 2 of the 4 tap water samples collected from houses supplied by wells or unknown sources. The concentrations of all detected VOCs were less than tap water RSLs and MCLs.

- Dioxins/furans were reported in all four tap water samples. The TEQ concentrations ranged from 0.000023 ng/L to 0.003 ng/L and exceeded the tap water RSL in one sample. The TEQ concentrations were less than the MCL in all samples. Figure 5-6 shows the location of the dioxin/furan exceedance.

- No SVOCs were detected in the tap water samples collected from houses supplied by wells or unknown sources in Study Area 5.

- No pesticides or PCBs were detected in tap water samples collected from houses supplied by wells or unknown sources in Study Area 5.

- Inorganics were detected frequently in the four samples. The concentrations of arsenic (2.55 to 17.9 ug/L) exceeded the tap water RSL in all four samples, were greater than 100 times the tap water RSL in 2 samples, and were greater than the MCL in two samples. The concentrations of the other inorganics were less than RSLs and MCLs in all samples. Figure 5-7 shows the locations of the arsenic exceedances.

- Chloride, fluoride, nitrate, and sulfate were detected in all four tap water samples. The concentration of nitrate in one sample (99.5 mg/L) exceeded the MCL but was less than the tap water RSL. The concentrations of the other parameters were less than the tap water RSLs and MCLs in all samples. Figure 5-8 shows the location of the nitrate exceedance.

- Gross alpha and gross beta radioactivity were reported in two samples. The concentrations of both radiological parameters were less than the MCLs in the samples.

- Two microbiological parameters (plate count and total coliform) were reported in 3 of 4 and 1 of 4 tap water samples, respectively. The total coliform count in the one sample exceeded the MCL. The plate counts were less than the MCL in all samples. Figure 5-9 shows the location of the total coliform exceedance.

In summary, concentrations of dioxins/furans (1 sample), arsenic (4 samples), nitrate (1 sample), and total coliform (1 sample) exceeded RSLs or MCLs in tap water samples collected from houses supplied by wells or unknown sources in Study Area 5.

5.1.6 Study Area 6

This section presents results for tap water samples collected from houses that received their water from a municipal water supply and from houses that received water from private wells or unknown sources in Study Area 6.

5.1.6.1 Study Area 6 – Houses Supplied by Municipal Water

Table 5-16 presents the chemicals that were detected in 11 tap water samples collected from dwellings that received their water from a municipal water supply at Study Area 6. Descriptive statistics are presented in Table 5-17. VOCs, dioxins/furans, inorganics, chloride, fluoride, nitrate, sulfate, radiological parameters, and one microbiological parameter were frequently detected in the municipal tap water samples.

- Six VOCs were detected in the 11 tap water samples collected from houses supplied by municipal water at Study Area 6. VOCs were detected infrequently in the tap water samples with the exception of bromoform and chlorodibromomethane. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment. Of the VOCs detected in the municipal samples, only the concentrations of chlorodibromomethane and PCE exceeded the tap water RSLs. Chlorodibromomethane was detected in 9 samples at concentrations ranging from 0.169 J ug/L to 0.995 ug/L. The concentrations of chlorodibromomethane exceeded the tap water RSL in 4 samples but were less than the MCL in all samples. PCE was detected in 1 of 11 samples at a concentration of 0.155 J ug/L which exceeded the tap water RSL but was less than the MCL. Figure 5-10 shows the location of the PCE exceedance.

- Dioxins/furans were reported in all 11 municipal water samples in Study Area 6. The TEQ concentrations ranged from 0.000005 ng/L to 0.000876 ng/L and exceeded the tap water RSL in one sample. The TEQ concentrations were less than the MCL in all samples. Figure 5-11 shows the location of the dioxin/furan exceedance.

- No SVOCs were detected in the municipal tap water samples collected in Study Area 6.

- No pesticides or PCBs were detected in the municipal tap water samples collected in Study Area 6.

- Inorganics were detected frequently in the municipal tap water samples. The concentrations of arsenic exceeded the tap water RSL in all 11 samples and were greater than 100 times the RSL in

one sample. Concentrations of arsenic were less than the MCL in all samples. The concentrations of the other inorganics were less than RSLs and MCLs in all samples.

- Chloride, fluoride, nitrate, and sulfate were frequently detected in the municipal tap water samples in Study Area 6. The concentration of nitrate in one sample (101 mg/L) exceeded the MCL but was less than the tap water RSL. The concentrations of the other parameters were less than the tap water RSLs and MCLs in all samples. Figure 5-12 shows the location of the nitrate exceedance.

- Gross alpha radioactivity was reported in five samples and gross beta was reported in six samples. The concentration of gross beta exceeded the MCL in one sample. Gross alpha concentrations were less than the MCL in all samples. Figure 5-13 shows the location of the gross beta exceedance.

- One microbiological parameter (plate count) was reported in 10 of 11 municipal tap water samples. The plate count (4510 CFU/1) in one sample exceeded the MCL.

In summary, concentrations of VOCs (4 samples), dioxins/furans (1 sample), arsenic (11 samples), nitrate (1 sample), gross beta radioactivity (1 sample), and plate count (1 sample) exceeded RSLs or MCLs in the municipal tap water samples collected from Study Area 6.

5.1.6.2 Study Area 6 – Houses Supplied by Wells or Unknown Sources

Table 5-18 presents the chemicals that were detected in one tap water sample collected from a dwelling that received their water from a well or unknown sources at Study Area 6. Descriptive statistics are presented in Table 5-19.

- Four VOCs (carbon tetrachloride, chloroform, PCE, and TCE) were detected in the tap water sample. The concentrations of carbon tetrachloride (2.56 ug/L), chloroform (1.19 ug/L), and PCE (0.413 ug/L) exceeded the tap water RSLs but were less than the MCLs. Figure 5-10 shows the location of the PCE exceedance.

- Dioxins/furans were detected in the tap water sample. The TEQ concentration (0.000354 ng/L) was less than the tap water RSL and the MCL.

- No SVOCs were detected in the tap water sample collected from a house supplied by wells or unknown sources in Study Area 6.

- No pesticides or PCBs were detected in the tap water sample collected from a house supplied by wells or unknown sources in Study Area 6.

- Inorganics were detected in the sample. The concentration of arsenic (5.23 ug/L) exceeded the tap water RSL but was less than the MCL. The concentrations of the other inorganics were less than RSLs and MCLs.

- Chloride, fluoride, nitrate, and sulfate were detected in the sample. The concentration of nitrate (90 mg/L) exceeded the MCL but was less than the tap water RSL. The concentrations of the other parameters were less than the tap water RSLs and MCLs. Figure 5-12 shows the location of the nitrate exceedance.

- Gross alpha and gross beta radioactivity were reported in the sample. The concentrations of both radiological parameters were less than the MCLs.

- No microbiological parameters were reported in the SA06 well sample.

In summary, concentrations of VOCs and arsenic exceeded RSLs or MCLs in the tap water sample collected from a house supplied by wells or unknown sources in Study Area 6.

5.1.7 Study Area 7

This section presents results for tap water samples collected from houses that received their water from a municipal water supply and from houses that received water from private wells or unknown sources in Study Area 7.

5.1.7.1 Study Area 7 – Houses Supplied by Municipal Water

Table 5-20 presents the chemicals that were detected in three tap water samples collected from dwellings that received their water from a municipal water supply at Study Area 7. Descriptive statistics are presented in Table 5-21. VOCs, dioxins/furans, inorganics, chloride, fluoride, nitrate, sulfate, radiological parameters, and one microbiological parameter were detected in the municipal tap water samples.

- Three VOCs (PCE, bromoform, and chlorodibromomethane) were detected in the three tap water samples collected from houses supplied by municipal water in Study Area 7. Of the VOCs detected in the three samples, only the concentration of PCE exceeded the tap water RSL. PCE was detected in one sample at a concentration of 0.247 ug/L which exceeded the RSL but was less than the MCL. Figure 5-14 shows the location of the PCE exceedance.

- Dioxins/furans were reported in the three municipal water samples in Study Area 7. The TEQ concentrations were less than the tap water RSL and the MCL in all samples.

- No SVOCs were detected in the municipal tap water samples collected in Study Area 7.

- No pesticides or PCBs were detected in the municipal tap water samples collected in Study Area 7.

- Inorganics were detected frequently in the municipal tap water samples. The concentrations of arsenic exceeded the tap water RSL in the three samples, was greater than 100 times the RSL in one sample, but were less than the MCL. The concentrations of the other inorganics were less than RSLs and MCLs in all samples.

- Chloride, fluoride, nitrate, and sulfate were detected in the three municipal tap water samples collected in Study Area 7. The concentration of nitrate in one sample (128 mg/L) exceeded the MCL but was less than the tap water RSL. The concentrations of the other parameters were less than the tap water RSLs and MCLs in all samples. Figure 5-15 shows the location of the nitrate exceedance.

- Gross alpha radioactivity was reported in one sample and gross beta was reported in two samples. The concentration of gross beta exceeded the MCL in one sample. Gross alpha concentrations were less than the MCL in all samples. Figure 5-16 shows the location of the gross beta exceedance.

- Two microbiological parameters (plate count and total coliform) were reported in 3 of 3 and 1 of 3 tap water samples, respectively. The total coliform count in the one sample exceeded the MCL. The plate counts were less than the MCL in all samples. Figure 5-17 shows the locations of the total coliform exceedance.

In summary, concentrations of VOCs (1 sample), arsenic (3 samples), nitrate (1 sample), gross beta radioactivity (1 sample), and total coliform (1 sample) exceeded RSLs or MCLs in the municipal tap water samples collected from Study Area 7.

5.1.7.2 Study Area 7 – Houses Supplied by Wells or Unknown Sources

Table 5-22 presents the chemicals that were detected in two tap water samples collected from dwellings that received their water from wells or unknown sources in Study Area 7. Descriptive statistics are presented in Table 5-23. VOCs, dioxins/furans, inorganics, chloride, fluoride, nitrate, sulfate, radiological parameters, and microbiological parameters were detected in the tap water samples.

- Four VOCs (chloroform, cis-1,2-dichloroethene, PCE, and TCE) were detected in the two tap water samples collected from houses supplied by wells or unknown sources. Of these, only the concentrations of PCE exceeded its screening level. PCE was detected in 2 of 2 samples at concentrations of 2.54 and 6.62 ug/L. The lesser concentration of PCE exceeded the tap water RSL and the inhalation RSL. The maximum concentration exceeded the tap water RSL, the inhalation RSL, and the MCL. The concentrations of all other detected VOCs were less than tap water RSLs and MCLs. Figure 5-14 shows the locations of the PCE exceedances.

- Dioxins/furans were reported in the two tap water samples. The TEQ concentrations were less than the tap water RSL and MCL in all samples.

- No SVOCs were detected in the two tap water samples collected from houses supplied by wells or unknown sources in Study Area 7.

- No pesticides or PCBs were detected in tap water samples collected from houses supplied by wells or unknown sources in Study Area 7.

- Inorganics were detected in the two samples. The concentrations of arsenic (6.85 and 7.03 ug/L) exceeded the tap water RSL in both samples, were greater than 100 times the tap water RSL in both samples, but were less than the MCL. The concentration of lead (26.7 ug/L) in one sample exceeded the action level. The concentrations of the other inorganics were less than RSLs and MCLs in all samples.

- Chloride, fluoride, nitrate, and sulfate were detected in the two tap water samples. The concentrations of nitrate in the samples (92.5 and 100 mg/L) exceeded the MCL but were less than the tap water RSL. The concentrations of the other parameters were less than the tap water RSLs and MCLs in both samples. Figure 5-15 shows the locations of the nitrate exceedances.

- Gross alpha and gross beta radioactivity were detected in the two samples. The concentrations of gross beta exceeded the MCL in both samples. The concentrations of gross alpha were less than the MCLs in both samples. Figure 5-16 shows the locations of the gross beta exceedances.

- Two microbiological parameters (plate count and total coliform) were reported in the two tap water samples. The total coliform count in the both samples exceeded the MCL and the plate count in one sample exceeded the MCL. Figure 5-17 shows the locations of the total coliform exceedances.

In summary, concentrations of VOCs (2 samples), arsenic (2 samples), lead (1 sample), nitrate (2 samples), gross beta (2 samples), total coliform (2 samples), and plate count (1 sample) exceeded RSLs or MCLs in tap water samples collected from houses supplied by wells or unknown sources in Study Area 7.

5.1.8 Study Area 8

This section presents results for tap water samples collected from houses that received their water from a municipal water supply and from houses that received water from private wells or unknown sources in Study Area 8.

5.1.8.1 Study Area 8 – Houses Supplied by Municipal Water

Table 5-24 presents the chemicals that were detected in 14 tap water samples collected from dwellings that received their water from a municipal water supply at Study Area 8. Descriptive statistics are presented in Table 5-25. VOCs, dioxins/furans, inorganics, chloride, fluoride, nitrate, sulfate, radiological parameters, and microbiological parameters were detected in the municipal tap water samples.

- Six VOCs were detected in the 14 tap water samples collected from houses supplied by municipal water at Study Area 8. Bromoform was the most frequently detected VOC being detected in 10 samples. Concentrations of bromoform ranged from 0.121 J ug/L to 5.39 ug/L, which were less than the RSL and MCL. Chlorodibromomethane was detected in eight samples at estimated concentrations ranging from 0.467 ug/L to 1.4 ug/L and the concentrations of chlorodibromomethane exceeded the tap water RSL in four samples but were less than the inhalation RSL and MCL in all samples. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment. PCE was detected in 2 samples at concentrations of 0.395 J ug/L and 3.1 ug/L. The concentrations of PCE exceeded the tap water RSL in two samples and the inhalation RSL in one sample but were less than the MCL in all samples. TCE was detected in one sample at a concentration of 0.431 J ug/L, which was less than the tap water and inhalation RSLs and MCL. Concentrations of the remaining VOCs were less than the RSLs and MCLs. Figure 5-18 shows the locations of the PCE exceedances.

- Dioxins/furans were reported in 12 municipal water samples in Study Area 8. The TEQ concentrations ranged from 0.000059 ng/L to 0.000702 ng/L and exceeded the tap water RSL in one sample. The TEQ concentrations were less than the MCL in all samples. Figure 5-19 shows the location of the dioxin/furan exceedance.

- No SVOCs, pesticides, or PCBs were detected in the municipal tap water samples collected in Study Area 8.

- Inorganics were detected frequently in the municipal tap water samples. The concentrations of arsenic exceeded the tap water RSL in 14 samples, were greater than 100 times the RSL in four samples, and exceeded the MCL in one sample. Concentrations of copper exceeded the RSL and action level in one sample. Concentrations of lead exceeded the action level in one sample. The concentrations of the other inorganics were less than RSLs and MCLs in all samples. Figure 5-20 shows the location of the arsenic exceedance; Figure 5-21 shows the location of the copper exceedance; and Figure 5-22 shows the location of the lead exceedance.

- Chloride, nitrate, and sulfate were detected in the 14 municipal tap water samples and fluoride was detected in 12 municipal tap water samples collected in Study Area 8. The concentration of nitrate in two samples exceeded the MCL but was less than the tap water RSL. The concentrations of the other parameters were less than the tap water RSLs and MCLs in all samples. Figure 5-23 shows the locations of the nitrate exceedances.

- Gross alpha radioactivity was reported in 6 samples and gross beta was reported in 11 samples. The concentration of gross beta exceeded the MCL in one sample. Gross alpha concentrations were less than the MCL in all samples. Figure 5-24 shows the location of the gross beta exceedance.

- Fecal coliform and fecal streptococcus were detected one sample. Total coliform was reported in three samples. The MCL for these parameters is 0 CFU/100. Therefore, the coliform and streptococcus counts exceeded the MCL in the samples where they were positively detected. Figure 5-25 shows the locations of the total and fecal coliform exceedances.

In summary, concentrations of VOCs (four samples), dioxins/furans (one sample), arsenic (14 samples), lead (1 sample), copper (1 sample), nitrate (2 samples), gross beta radioactivity (1 sample), and microbiological parameters (3 samples) exceeded RSLs, action levels or MCLs in the municipal tap water samples collected from Study Area 8.

5.1.8.2 Study Area 8 – Houses Supplied by Wells or Unknown Sources

Table 5-26 presents the chemicals that were detected in 24 tap water samples collected from Study Area 8. The sources of the tap water samples collected from Study Area 8 are private wells or unknown sources. Descriptive statistics are presented in Table 5-27. VOCs, dioxins/furans, inorganics, chloride, fluoride, nitrate, sulfate, gross alpha and gross beta radioactivity, and total coliform were frequently detected in the tap water samples.

- Ten VOCs were detected in the tap water samples collected at Study Area 8. VOCs were detected infrequently in the tap water samples with the exception of PCE, TCE, and chloroform. PCE was detected in 18 samples at estimated concentrations ranging from 0.312 ug/L to 50.1 ug/L. PCE exceeded the tap water RSL in 18 samples, the inhalation RSL in 12 samples, and the MCL in 6 samples. The concentrations of PCE also were greater than 100 times the carcinogenic RSL in three samples. TCE was detected in 9 samples at concentrations ranging from 0.134 J ug/L to 1.11 ug/L. The concentrations of TCE were less than RSLs and the MCL in all samples. Chloroform was detected in seven samples at concentrations ranging from 0.0972 J ug/L to 0.281 J ug/L. The concentrations of chloroform exceeded the tap water RSL and the inhalation RSL in one sample but were less than the MCL in all samples. The remaining VOCs were detected in three or less samples and were less than the screening criteria. Figure 5-18 shows the locations of the PCE exceedances.

- Dioxins/furans were reported in all 24 tap water samples. The TEQ concentrations ranged from 0.000011 ng/L to 0.005 ng/L and exceeded the tap water RSL in two samples. The TEQ concentrations were less than the MCL in all samples. Figure 5-19 shows the locations of the dioxin/furan exceedances.

- Two SVOCs (bis(2-ethylhexyl)phthalate and di-n-octylphthalate) were detected in one tap water sample at concentrations less than RSLs and/or MCLs.

- No pesticides or PCBs were detected in the tap water samples collected in Study Area 8.

- Inorganics were detected frequently in the tap water samples, with the exception of mercury and thallium. The concentrations of arsenic exceeded the tap water RSL in all 24 samples and were greater than 100 times the carcinogenic RSL in 22 samples. Arsenic was less than the MCL in all samples. The concentrations of copper (10.3 ug/L to 2360 ug/L) exceeded the tap water RSL and action level in four samples. Figure 5-21 shows the locations of the copper exceedances.

- Chloride, fluoride, nitrate, and sulfate were detected in all tap water samples. The concentrations of nitrate (10.4 to 112 mg/L) exceeded the MCL in 22 samples but were less than the tap water RSL in all samples. Figure 5-23 shows the locations of the nitrate exceedances.

- Gross alpha radioactivity was reported in 22 samples and gross beta was detected in all samples. The concentrations of gross alpha exceeded the MCL in two samples and gross beta exceeded the MCL in 15 samples. Figure 5-24 shows the locations of the gross alpha and beta exceedances.

- Fecal coliform and fecal streptococcus were detected in six and four samples, respectively. Total coliform was reported in 20 samples. The MCL for these parameters is 0 CFU/100. Therefore, the coliform and streptococcus counts exceeded the MCL in the samples where they were detected. Figure 5-25 shows the locations of the fecal coliform exceedances.

In summary, concentrations of VOCs (18 samples), dioxins/fruans (2 samples), arsenic (24 samples), copper (4 samples), nitrate (22 samples), radiological parameters (15 samples), and microbiological parameters (20 samples) exceeded RSLs, action levels, or MCLs in tap water samples collected from Study Area 8.

5.1.9 Study Area 9

Table 5-28 presents the chemicals that were detected in two tap water samples collected from dwellings that received their water from a municipal water supply at Study Area 9. Descriptive statistics are presented in Table 5-29. VOCs, dioxins/furans, inorganics, chloride, nitrate, sulfate, and one microbiological parameter were detected in the municipal tap water samples.

- Four VOCs (bromodichloromethane, bromoform, chlorodibromomethane, and chloroform) were detected in the two tap water samples collected from houses supplied by municipal water at Study Area 9. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment. Of the VOCs detected in the municipal samples, only the concentration of chlorodibromomethane in one sample exceeded the tap water RSL. Chlorodibromomethane was detected in one sample at a concentration of 1.12 ug/L which exceeded the tap water RSL but was less than the MCL.

- Dioxins/furans were reported in the two municipal water samples in Study Area 9. The TEQ concentrations were less that the tap water RSL and MCL in all samples.

- No SVOCs were detected in the municipal tap water samples collected in Study Area 9.

- No pesticides or PCBs were detected in the municipal tap water samples collected in Study Area 9.

- Inorganics were detected frequently in the municipal tap water samples. The concentrations of arsenic exceeded the tap water RSL in both samples but were less than the MCL. The concentrations of the other inorganics were less than RSLs and MCLs in all samples.

- Chloride, nitrate, and sulfate were detected in the two municipal tap water samples collected in Study Area 9 and the concentrations of these inorganics were less than the tap water RSLs and MCLs in both samples.

- No radiological parameters were detected in the municipal tap water samples collected in Study Area 9.

- One microbiological parameter (plate count) was reported in 1 of 2 municipal tap water samples. The plate count was less than the MCL.

In summary, concentrations of VOCs (1 sample) and arsenic (2 samples) exceeded RSLs in the municipal tap water samples collected from Study Area 9.

5.2 GOVERNMENT-LEASED PARCOS AND NAVFAC-LEASED HOMES

5.2.1 Parco Artemide

Table 5-30 presents the chemicals that were detected in the 10 tap water samples collected at Parco Artemide. The tap water samples collected at Parco Artemide are from municipal water supplies. Descriptive statistics are presented in Table 5-31. VOCs, dioxins/furans, SVOCs, inorganics, chloride, fluoride, nitrate, sulfate, and gross beta radioactivity were detected in the tap water samples.

- Eight VOCs were detected in the tap water samples collected at Parco Artemide. VOCs were detected frequently in the tap water samples. Bromoform was detected in 10 samples at concentrations ranging from 0.51 J ug/L to 2.96 ug/L. Chlorodibromomethane was detected in 10 samples at concentrations ranging from 0.241 J ug/L to 0.652 ug/L. Chloroform was detected in nine samples at concentrations ranging from 0.0962 J ug/L to 0.151 J ug/L. Bromodichloromethane was detected in nine samples at concentrations ranging from 0.141 J ug/L to 0.299 J ug/L. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment. The remaining VOCs were detected in four or less samples. Concentrations of all VOCs were less than the RSLs and the MCL in all samples.

- The TEQ concentrations ranged from 0.000028 ng/L to 0.00034 ng/L, which are less than the tap water RSL and MCL.

- Four SVOCs were detected in the tap water samples. Aniline and butyl benzyl phthalate were detected in two samples and 2-methylnaphthalene was detected in one sample at concentrations less

than the RSLs and MCLs. Naphthalene was detected in one sample at a concentration exceeding the tap water and inhalation RSLs. Figure 5-26 shows the location of the naphthalene exceedance.

- No pesticides or PCBs were detected in the tap water samples collected at Parco Artemide.

- Inorganics were detected frequently in the tap water samples, with the exception of aluminum and silver which were only detected in three and one sample, respectively. Concentrations of arsenic exceeded the tap water RSL in all 10 samples and were greater than 100 times the carcinogenic RSL in three samples. Arsenic was less than the MCL in all samples. Concentrations of lead exceeded its action level in two samples. Concentrations of nickel exceeded the tap water RSL in three samples. Figure 5-27 shows the locations of the lead exceedances and Figure 5-28 shows the location of the nickel exceedances.

- Gross beta radioactivity was detected in one sample, although the detected concentration was less than the MCL.

- No microbiological parameter exceeded the MCL.

- Chloride, nitrate, and sulfate were detected in all tap water samples and fluoride was detected in one sample. The detected concentrations were less than the screening levels in all samples.

In summary, concentrations of SVOCs (one sample), arsenic (10 samples), lead (two samples), and nickel (three samples) exceeded RSLs in tap water samples collected from Parco Artemide.

5.2.2 Parco Eva

Table 5-32 presents the chemicals that were detected in the 10 tap water samples collected from Parco Eva. The tap water samples collected at Parco Eva are from municipal water supplies. Descriptive statistics are presented in Table 5-33. VOCs, dioxins/furans, inorganics, chloride, fluoride, nitrate, sulfate, and gross beta radioactivity were detected in the tap water samples.

- Six VOCs were detected in the tap water samples collected at Parco Eva. VOCs were detected frequently in the tap water samples. Bromoform was detected in 10 samples at concentrations ranging from 1.44 ug/L to 2.38 ug/L. Chlorodibromomethane was detected in nine samples at concentrations ranging from 0.203 J ug/L to 0.501 ug/L. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment. The remaining VOCs were detected in three or less samples. Concentrations of all VOCs were less than RSLs and the MCL in all samples.

- The TEQ concentrations ranged from 0.000002 ng/L to 0.002114 ng/L and exceeded the tap water RSL in two samples. The TEQ concentrations were less than the MCL in all samples. Figure 5-29 shows the locations of the dioxin/furan exceedances.

- No SVOCs, pesticides, or PCBs were detected in the tap water samples collected from Parco Eva.

- Inorganics were detected frequently in the tap water samples, with the exception of aluminum, thallium, and silver which were only detected in one, one, and two samples, respectively. The concentrations of arsenic exceeded the tap water RSL in all 10 samples but were less than the MCL in all samples. Concentrations of nickel exceeded the tap water RSL in one sample. Figure 5-30 shows the location of the exceedance.

- Gross beta radioactivity was detected in eight samples, but the detected concentrations were less than the MCL.

- No microbiological parameters exceeded the MCLs.

- Chloride, nitrate, and sulfate were detected in all tap water samples and fluoride was detected in eight samples. The detected concentrations were less than the screening levels in all samples.

In summary, concentrations of dioxins/furans (two samples), arsenic (10 samples), and nickel (one sample) exceeded RSLs in tap water samples collected from Parco Eva.

5.2.3 Parco Le Ginestre

Table 5-34 presents the chemicals that were detected in the 10 tap water samples collected at Parco Le Ginestre. The tap water samples collected at Parco Le Ginestre are municipal water supplies. Descriptive statistics are presented in Table 5-35. VOCs, dioxins/furans, SVOCs, inorganics, chloride, fluoride, nitrate, sulfate, and gross alpha and gross beta radioactivity were detected in the tap water samples.

- Seven VOCs were detected in the tap water samples collected from Parco Le Ginestre. Chloroform was detected in ten samples at estimated concentrations ranging from 0.131 ug/L to 0.4 ug/L. Chloroform exceeded the tap water and inhalation RSLs in eight samples, but was less than the MCL in all samples. Chlorodibromomethane was detected in ten samples at estimated concentrations ranging from 0.372 ug/L to 1.01 ug/L. Chlorodibromomethane exceeded the tap water RSLs in three

samples, but was less than the MCL in all samples. Bromoform was detected in 10 samples at concentrations ranging from 0.42 ug/L to 0.982 J ug/L, which are less than the tap water RSL and MCL. Bromodichloromethane was detected in 10 samples at estimated concentrations ranging from 0.186 ug/L to 0.694 ug/L, which are less than the tap water RSL and MCL. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment. PCE was detected in one sample at a concentration of 2.51 ug/L, which exceeds the tap water and inhalation RSLs. The detected concentration of PCE was less than the MCL. The remaining VOCs were detected in one sample at concentrations less than RSLs and the MCLs. The location of the PCE exceedance is shown on Figure 5-31.

- The TEQ concentrations ranged from 0.000034 ng/L to 0.000843 ng/L and exceeded the tap water RSL in one sample. The TEQ concentrations were less than the MCL in all samples. Figure 5-32 shows the location of the dioxin/furan exceedances.

- Butyl benzyl phthalate was the only SVOC detected in the tap water samples. Butyl benzyl phthalate was detected in only one sample and the detected concentration was less than the RSLs.

- No pesticides or PCBs were detected in the tap water samples collected from Parco Le Ginestre.

- Inorganics were detected frequently in the tap water samples, with the exception of aluminum, antimony, beryllium, and tin which were only detected in three or less samples. The concentrations of arsenic exceeded the tap water RSL in all 10 samples and was greater than 100 times the carcinogenic RSL in one sample. Arsenic was less than the MCL in all samples.

- Gross alpha radioactivity was reported in one sample and gross beta was detected in three samples. The concentrations of gross alpha and gross beta were less than the MCLs in all samples.

- No microbiological parameter exceeded the MCL.

- Chloride, nitrate, and sulfate were detected in all tap water samples and fluoride was detected in one sample. The detected concentrations were less than the screening levels in all samples.

In summary, concentrations of VOCs (eight samples), dioxins/furans (one sample), and arsenic (10 samples) exceeded RSLs in tap water samples collected from Parco Le Ginestre.

5.2.4 NAVFAC-Leased Homes

Table 5-36 presents the chemicals that were detected in the six tap water samples collected from the six NAVFAC-leased homes. The tap water samples collected at the NAVFAC-leased homes are from municipal water supplies. Descriptive statistics are presented in Table 5-37. VOCs, dioxins/furans, inorganics, chloride, fluoride, nitrate, sulfate, and gross alpha and gross beta radioactivity were detected in the tap water samples.

- Nine VOCs were detected in the tap water samples collected at the NAVFAC-leased homes. Chloroform was detected in one sample at an estimated concentration of 0.212 ug/L, which exceeded the tap water and inhalation RSLs, but was less than the MCL. Bromoform was detected in five samples at concentrations ranging from 0.403 J ug/L to 6 ug/L, which were less than the tap water RSL and MCL. Chlorodibromomethane was detected in 4 samples at concentrations ranging from 0.466 J ug/L to 0.77 ug/L, which were less than the tap water RSL and MCL. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment. PCE was detected in one sample at an estimated concentration of 0.232 ug/L, which was less than the tap water and inhalation RSLs and MCL. TCE was detected in three samples at concentrations ranging from 0.294 J ug/L to 0.727 J ug/L, which were less than the tap water RSL and MCL. The remaining VOCs were detected in two or less samples at concentrations less than RSLs and the MCL.

- The TEQ concentrations ranged from 0.000049 ng/L to 0.000412 ng/L, which were less than the tap water RSL and MCL.

- No SVOCs, pesticides, or PCBs were detected in the tap water samples collected at the NAVFAC-leased homes.

- Inorganics were detected frequently in the tap water samples, with the exception of aluminum which was detected in only two samples and mercury and tin which were only detected in one sample. The concentrations of arsenic exceeded the tap water RSL in all six samples and was greater than 100 times the carcinogenic RSL in one sample. Arsenic was less than the MCL in all samples. Concentrations of cobalt exceeded the tap water RSL in one sample.

- Gross alpha radioactivity was reported in two samples and gross beta was detected in four samples. The concentrations of gross alpha and gross beta were less than the MCLs in all samples.

- No microbiological parameter exceeded the MCL.

- Chloride, nitrate, and sulfate were detected in all tap water samples and fluoride was detected in four samples. The detected concentrations were less than the screening levels in all samples.

In summary, concentrations of VOCs (one sample), arsenic (six samples), and cobalt (one sample) exceeded RSLs in tap water samples collected from the NAVFAC-leased homes.

5.3 GOVERNMENT-BASED PROPERTIES

5.3.1 Gricignano Support Site

Table 5-38 presents the chemicals that were detected in the 10 tap water samples collected at Gricignano Support Site. It was determined that tap water samples collected from the Gricignano Support Site were connected to municipal water supplies. Descriptive statistics are presented in Table 5-39. VOCs, dioxins/furans, inorganics, chloride, nitrate, sulfate, and gross beta radioactivity were detected in the tap water samples.

- Four VOCs were detected in the tap water samples collected at Gricignano Support Site. VOCs were detected frequently in the tap water samples. Chloroform was detected in seven samples at estimated concentrations ranging from 0.125 ug/L to 0.486 ug/L. The concentrations of chloroform exceeded the tap water RSL and the inhalation RSL in three samples but were less than the MCL in all samples. Chlorodibromomethane was detected in six samples at concentrations ranging from 0.95 ug/L to 1.68 ug/L. Concentrations of chlorodibromomethane exceeded the tap water RSL in all six samples but were less than the inhalation RSL and MCL in all samples. Bromoform was detected in six samples at concentrations ranging from 1.14 ug/L to 1.98 ug/L, which were less than the tap water and inhalation RSLs and MCL. Bromodichloromethane was detected in six samples at estimated concentrations ranging from 0.407 ug/L to 0.76 ug/L, which were less than the tap water and inhalation RSLs and MCL. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment.

- The TEQ concentrations ranged from 0.000013 ng/L to 0.001248 ng/L and exceeded the tap water RSL in one sample. The TEQ concentrations were less than the MCL in all samples.

- No SVOCs, pesticides, or PCBs were detected in the tap water samples collected from the Gricignano Support Site.

- Twenty inorganics were detected in the tap water samples collected from the Gricignano Support Site. The concentrations of arsenic exceeded the tap water RSL in all 10 samples and were greater

than 100 times the carcinogenic RSL in six samples. Arsenic was less than the MCL in all samples. The concentrations of lead exceeded the action level in two samples.

- Gross beta radioactivity was detected in one sample, although the detected concentration was less than the MCL.

- No microbiological parameters exceeded the MCLs.

- Chloride, nitrate, and sulfate were detected in all tap water samples. The detected concentrations were less than the screening criteria in all samples.

In summary, concentrations of VOCs (six samples), dioxins/furans (one sample), arsenic (10 samples), and lead (two samples) exceeded RSLs or action levels in tap water samples collected from the Gricignano Support Site.

5.3.2 Capodichino

Table 5-40 presents the chemicals that were detected in the 10 tap water samples collected from Capodichino. It was determined that tap water samples collected from Capodichino were connected to municipal water supplies. Descriptive statistics are presented in Table 5-41. VOCs, dioxins/furans, SVOCs, inorganics, chloride, nitrate, and sulfate were detected in the tap water samples.

- Five VOCs were detected in the tap water samples collected from Capodichino. Chlorodibromomethane was detected in ten samples at estimated concentrations ranging from 0.306 ug/L to 1.97 ug/L. Chlorodibromomethane exceeded the tap water RSL in one sample, but was less than the inhalation RSL and MCL in all samples. Chloroform was detected in six samples at estimated concentrations ranging from 0.0922 ug/L to 0.46 ug/L. Chloroform exceeded the tap water and inhalation RSLs in two samples, but was less than the MCL in all samples. Bromoform was detected in 10 samples at estimated concentrations ranging from 0.464 ug/L to 1.83 ug/L, which were below the tap water and inhalation RSLs and MCL. Bromodichloromethane was detected in eight samples at estimated concentrations ranging from 0.141 ug/L to 0.855 ug/L, which were below the tap water and inhalation RSLs and MCL. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment. Acetone was detected in six samples at estimated concentrations ranging from 1.01 ug/L to 1.74 ug/L, which were less than the tap water RSL.

- The TEQ concentrations ranged from 0.000098 ng/L to 0.00036 ng/L, which were less than the tap water RSL and MCL.

- Di-n-octyl phthalate was the only SVOC detected in the tap water samples. Di-n-octyl phthalate was detected in only one sample and the detected concentration was less than the RSL.

- No pesticides or PCBs were detected in the tap water samples collected from Capodichino.

- Twenty inorganics were detected in the tap water samples collected from Capodichino. The concentrations of arsenic exceeded the tap water RSL in all 10 samples, but were less than 100 times the carcinogenic RSL and the MCL in all samples.

- Gross alpha and gross beta radioactivity were not detected in any sample.

- No microbiological parameters exceeded the MCLs

- Chloride, nitrate, and sulfate were detected in all tap water samples. The detected concentrations were less than the screening levels in all samples.

In summary, concentrations of VOCs (two samples) and arsenic (10 samples) exceeded RSLs in tap water samples collected from Capodichino.

5.3.3 Lago Patria Receiver Site

Table 5-42 presents the chemicals that were detected in the three tap water samples collected from the Lago Patria Receiver Site. It was determined that tap water samples collected from the Lago Patria Receiver Site were connected to municipal water supplies. Descriptive statistics are presented in Table 5-43. VOCs, dioxins/furans, inorganics, chloride, nitrate, and sulfate were detected in the tap water samples.

- Three VOCs were detected in the tap water samples collected from the Lago Patria Receiver Site. Bromoform was detected in three samples at estimated concentrations ranging from 0.63 ug/L to 0.95 ug/L. Chlorodibromomethane was detected in three samples at estimated concentrations ranging from 0.381 ug/L to 0.53 ug/L. Chloroform was detected in one sample at a concentration of 0.139 J ug/L. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment. The concentrations of VOCs were less than RSLs and the MCL in all samples.

- The TEQ concentrations ranged from 0.000003 ng/L to 0.00005 ng/L, which were less than the tap water RSL and MCL.

- No SVOCs, pesticides, or PCBs were detected in the tap water samples collected at the Lago Patria Receiver Site.

- Twenty inorganics were detected in the tap water samples collected from the Lago Patria Receiver Site. The concentrations of arsenic exceeded the tap water RSL in all three samples but were less than 100 times the carcinogenic RSL and MCL in all samples. Lead exceeded the action level in one sample.

- Gross alpha and gross beta radioactivity were not detected in any sample.

- No microbiological parameters exceeded the MCLs.

- Chloride, nitrate, and sulfate were detected in all tap water samples. The detected concentrations were less than the screening levels in all samples.

In summary, concentrations of arsenic (three samples) and lead (one sample) exceeded RSLs or action levels in tap water samples collected from the Lago Patria Receiver Site.

5.3.4 Carney Park

Table 5-44 presents the chemicals that were detected in the three tap water samples collected from Carney Park. It was determined that tap water samples collected from Carney Park were connected to municipal water supplies. Descriptive statistics are presented in Table 5-45. VOCs, inorganics, chloride, nitrate, and sulfate, and gross alpha and gross beta radioactivity were detected in the tap water samples.

- Seven VOCs were detected in the tap water samples collected from Carney Park. Chlorodibromomethane was detected in three samples at estimated concentrations ranging from 3.66 ug/L to 5.72 ug/L. Chlorodibromomethane exceeded the tap water RSL in three samples, but was less than the inhalation RSL and MCL in all samples. Chloroform was detected in three samples at concentrations ranging from 0.65 ug/L to 0.83 ug/L. Chloroform exceeded the tap water and inhalation RSLs in three samples, but was less than the MCL in all samples. Bromodichloromethane was detected in three samples at concentrations ranging from 1.31 ug/L to 2.28 ug/L. Bromodichloromethane exceeded the tap water and inhalation RSLs in three samples, but was less than the MCL in all samples. Bromoform was detected in three samples at estimated concentrations ranging from 4.82 ug/L to 7.06 ug/L, which were less than the tap water and inhalation RSLs and MCL. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment. PCE was detected in two samples at estimated concentrations of 0.113 ug/L and

0.13 ug/L. PCE exceeded the tap water RSLs in two samples, but was less than the MCL in all samples. TCE was detected in three samples at concentrations ranging from 0.402 J ug/L to 0.44 ug/L, which were less than the tap water RSL and MCL. cis-1,2-Dichloroethene was detected in two samples at estimated concentrations ranging from 0.213 ug/L to 0.224 J ug/L, which was less than the RSL and MCL.

- No dioxins/furans congeners, SVOCs, pesticides, or PCBs were detected in the tap water samples collected from Carney Park.

- Seventeen inorganics were detected in the tap water samples collected from Carney Park. The concentrations of arsenic exceeded the tap water RSL in all three samples and was greater than 100 times the carcinogenic RSL in one sample. Arsenic was less than the MCL in all samples.

- Gross alpha and gross beta radioactivity were not detected in any sample.

- No microbiological parameters exceeded the MCLs.

- Chloride, nitrate, fluoride, and sulfate were detected in all tap water samples. The detected concentrations were less than the screening levels in all samples.

In summary, concentrations of VOCs (three samples) and arsenic (three samples) exceeded RSLs in tap water samples collected from Carney Park.

5.3.5 JFC NATO Site

Table 5-46 presents the chemicals that were detected in the three tap water samples collected from the JFC NATO Site. It was determined that tap water samples collected from the JFC NATO Site were connected to municipal water supplies. Descriptive statistics are presented in Table 5-47. VOCs, dioxins/furans, inorganics, chloride, nitrate, and sulfate were detected in the tap water samples.

- Four VOCs were detected in the tap water samples collected at the JFC NATO Site. TCE was detected in one sample at an estimated concentration of 0.179 ug/L. Bromoform was detected in three samples at estimated concentrations ranging from 0.73 ug/L to 1.28 ug/L. Chlorodibromomethane was detected in three samples at estimated concentrations ranging from 0.277 ug/L to 0.638 ug/L. Bromodichloromethane was detected in one sample at an estimated concentration of 0.222 ug/L. The concentrations of VOCs were less than RSLs and the MCL in all samples.

- The TEQ concentrations ranged from 0.000101 ng/L to 0.000365 ng/L, which were less than the tap water RSL and MCL.

- No SVOCs, pesticides, or PCBs were detected in the tap water samples collected from the JFC NATO Site.

- Sixteen inorganics were detected in the tap water samples collected from the JFC NATO Site. The concentrations of arsenic exceeded the tap water RSL in all three samples but were less than the MCL in all samples.

- Gross alpha and gross beta radioactivity were not detected in any sample.

- No microbiological parameters exceeded the MCLs.

- Chloride, nitrate, and sulfate were detected in all tap water samples. The detected concentrations were less than the screening levels in all samples.

In summary, concentrations of arsenic (three samples) exceeded RSLs in tap water samples collected from the JFC NATO Site.

5.3.6 U.S. Consulate

Table 5-48 presents the chemicals that were detected in the four tap water samples collected from the U.S. Consulate. It was determined that tap water samples collected from the U.S. Consulate were connected to municipal water supplies. Descriptive statistics are presented in Table 5-49. VOCs, dioxins/furans, inorganics, chloride, nitrate, and sulfate, and gross alpha and gross beta radioactivity were detected in the tap water samples.

- Ten VOCs were detected in the tap water samples collected from the U.S. Consulate. Chlorodibromomethane was detected in four samples at concentrations ranging from 0.56 ug/L to 1.03 ug/L. Chlorodibromomethane exceeded the tap water RSLs in two samples, but was less than the inhalation RSL and MCL in all samples. Chloroform was detected in four samples at estimated concentrations ranging from 0.218 ug/L to 0.372 ug/L. Chloroform exceeded the tap water and inhalation RSLs in four samples, but was less than the MCL in all samples. These chemicals are trihalomethanes, disinfectant by-products associated with water treatment. PCE was detected in four samples at concentrations ranging from 0.257 J ug/L to 0.57 J ug/L. PCE exceeded the tap water

RSL in four samples, but was less than the MCL in all samples. TCE was detected in four samples at concentrations ranging from 0.719 J ug/L to 1.53 ug/L, which was less than the tap water RSL and MCL. Concentrations of the remaining VOCs were less than the RSLs and MCLs.

- The TEQ concentrations ranged from 0.000001 ng/L to 0.001101 ng/L and exceeded the tap water RSL in one sample. The TEQ concentrations were less than the MCL in all samples.

- No SVOCs, pesticides, or PCBs were detected in the tap water samples collected from the U.S. Consulate.

- Eighteen inorganics were detected in the tap water samples collected from the U.S. Consulate. The concentrations of arsenic exceeded the tap water RSL in all four samples and were greater than 100 times the carcinogenic RSL in two samples. Arsenic was less than the MCL in all samples. The concentrations of lead exceeded its action level in two samples.

- Gross alpha radioactivity was reported in three samples and gross beta was detected in four samples. The concentrations of gross alpha and gross beta were less than the MCLs in all samples.

- No microbiological parameters exceeded the MCLs.

- Chloride, nitrate, fluoride, and sulfate were detected in all tap water samples. The detected concentrations were less than the screening levels in all samples.

In summary, concentrations of VOCs (four samples), dioxins/furans (one sample), arsenic (four samples) and lead (two samples) exceeded RSLs or action levels in tap water samples collected from the U.S. Consulate.

5.4 BACKGROUND COMPARISON

Arsenic, gross alpha and gross beta, nitrate, and PCE were widely detected in tap water samples at concentrations greater than their residential RSLs. The presence of these constituents could be attributed to naturally occurring or anthropogenic background. To determine whether these constituents were attributable to background, various statistical techniques were applied to the data, as outlined in "Procedural Guidance for Statistically Analyzing Environmental Background Data" (U.S. Navy, 1998). The results of the statistical analysis are presented in Appendix D.

5.4.1 Arsenic

Arsenic was detected in all tap water samples. For tap water samples collected from residences connected to a municipal water supply, the arsenic concentrations ranged from 0.57 to 118 ug/L, with a mean concentration of 4.7 ug/L and a median concentration of 3.6 ug/L. For tap water samples collected from residences that receive their water from a well or unknown source, the arsenic concentrations ranged from 2.55 to 41.5 ug/L with a mean concentration of 7 ug/L and a median concentration of 5.8 ug/L.

For the actual and log-transformed tap water data collected from a municipal water supply, the two highest concentrations deviated from the remainder of the data set (Figure 5-33). The point of inflection on the probability plot is at 11.6 ug/L; therefore, arsenic concentrations from public water sources at concentrations less than 12 ug/L could be considered naturally occurring background. For the actual and log-transformed tap water data collected from a well or unknown source, the five highest concentrations deviated from the remainder of the data set (Figure 5-34). The point of inflection on the probability plot is at 8.4 ug/L; therefore, arsenic concentrations from private water sources at concentrations less than 8 ug/L could be considered naturally occurring background. Overall, there does not appear to be a significant difference in the nature of arsenic concentrations between the two water supplies. Tap water arsenic concentrations up to 12 ug/L could be considered naturally occurring background.

5.4.2 Gross Alpha

Gross alpha radiation was detected in 27 percent of the tap water samples collected from a municipal water supply; gross alpha radiation was detected in 79 percent of the tap water samples collected from a well or unknown source. For those tap water samples collected from residences connected to a municipal water supply, the concentrations ranged from 0.4 pCi/L to 12.7 pCi/L, with a mean concentration of 1.3 pCi/L and a median concentration of 0.7 pCi/L. For those tap water samples collected from residences that receive their water from a well or an unknown source, the concentrations ranged from 0.55 pCi/L to 20.8 pCi/L, with a mean concentration of 4.7 pCi/L and a median concentration of 4.1 pCi/L. The eight highest concentrations of tap water samples from a public water supply deviated from the remainder of the data set; the point of inflection is at 3.5 pCi/L (Figure 5-35). The tap water samples collected from wells approximate a normal distribution (Figure 5-36). Therefore, concentrations up to 10 pCi/L could be considered naturally occurring background.

5.4.3 Gross Beta

Gross beta radiation was detected in 41 percent of the tap water samples collected from a municipal water supply; gross beta radiation was detected in 87 percent of the tap water samples collected from a

well or unknown source. For those tap water samples collected from residences connected to a municipal water supply, the concentrations ranged from 2.7 pCi/L to 15.6 pCi/L, with a mean concentration of 8.8 pCi/L and a median concentration of 3 pCi/L. For those tap water samples collected from residences that receive their water from a well or an unknown source, the concentrations ranged from 2.3 pCi/L to 75.4 pCi/L, with a mean concentration of 48 pCi/L and a median concentration of 41 pCi/L. The ten highest concentrations of tap water samples from a public water supply deviated from the remainder of the data set; the point of inflection is at 21 pCi/L (Figure 5-37). An inflection point can be seen on the normal probability plot at approximately 40 pCi/L for tap water samples collected from a private or unknown source (Figure 5-38). Therefore, concentrations up to 40 pCi/L could be considered naturally occurring background.

5.4.4 Nitrate

Nitrate was detected in 99 percent of the tap water samples collected from a municipal water supply; nitrate was detected in 79 percent of the tap water samples collected from a well or unknown source. For those tap water samples collected from residences connected to a municipal water supply, the concentrations ranged from 0.1 mg/L to 12.8 mg/L, with a mean concentration of 10.3 mg/L and a median concentration of 3.7 mg/L. For those tap water samples collected from residences that receive their water from a well or an unknown source, the concentrations ranged from 2.8 mg/L to 117 mg/L, with a mean concentration of 68 mg/L and a median concentration of 83 mg/L. The nine highest concentrations of tap water samples from a public water supply deviated from the remainder of the data set; the point of inflection is at 24 mg/L (Figure 5-39). The histogram and the probability plot of tap water samples collected from a private water supply or unknown source suggest that there is a deviation from the data set at 60 mg/L (Figure 5-40). Therefore, concentrations up to 60 mg/L could be considered naturally occurring background.

5.4.5 PCE

PCE was detected in 18 percent of the tap water samples collected from a municipal water supply; PCE was detected in 64 percent of the tap water samples collected from a well or unknown source. For those tap water samples collected from residences connected to a municipal water supply, the concentrations ranged from 0.04 ug/L to 5.65 ug/L, with a mean concentration of 0.13 ug/L and a median concentration of 0.04 ug/L. For those tap water samples collected from residences that receive their water from a well or an unknown source, the concentrations ranged from 0.04 ug/L to 94.2 ug/L, with a mean concentration of 8.8 ug/L and a median concentration of 0.4 ug/L. The five highest concentrations of tap water samples collected from a public water supply deviated from the remainder of the data set; the point of inflection is at 0.6 ug/L (Figure 5-41). The 12 highest concentrations of tap water samples collected from a public water supply deviate from the remainder of the data set; the point of inflection is at 20 ug/L (Figure 5-42).

Therefore, concentrations up to 17 ug/L could be considered background, most likely from anthropogenic sources.

5.5 SUMMARY

At those residences where the source of the tap water samples is a municipal water supply, arsenic exceeded its RSL in all samples and exceeded its MCL in one sample in Study Area 8. Trihalomethanes and chloroform were widely detected at concentrations greater than their RSLs, but this is expected because of the treatment associated with a municipal water supply. The trihalomethanes were not detected at concentrations greater than MCLs. PCE and dioxins/furans were widely detected at concentrations greater than tap water RSLs, but were not detected at concentrations greater than MCLs. SVOCs were infrequently detected, and were not detected at concentrations greater than RSLs. Pesticides and PCBs were not detected in any samples. Nitrates were detected at concentrations greater than MCLs in Study Areas 6, 7, and 8. Tap water samples also had exceedances of the gross alpha or gross beta MCLs in Study Areas 6, 7, and 8. Exceedances of total or fecal coliform MCLs were also present in tap water samples collected from these three study areas. Table 5-50 summarizes the tap water results collected from across the region that are from a municipal water supply.

At those residences where the source of the tap water samples is a private well or unknown source, arsenic exceeded its RSL in all samples and exceeded its MCL in samples collected from Study Areas 5 and 8. Trihalomethanes and chloroform were less frequently detected at concentrations greater than their RSLs relative to those tap water samples associated with a municipal water supply. As with the tap water samples, the trihalomethanes were not detected at concentrations greater than MCLs. PCE and dioxins/furans were widely detected at concentrations greater than tap water RSLs and were detected at concentrations greater than MCLs in Study Areas 7 and 8. SVOCs were infrequently detected, and were only detected at concentrations greater than RSLs in Study Area 8. The SVOCs detected at concentrations greater than RSLs were phthalates. Pesticides and PCBs were not detected in any samples. Nitrates were detected at concentrations greater than MCLs in Study Areas 5, 6, 7, and 8. Tap water samples also had exceedances of the gross alpha or gross beta MCLs in Study Areas 7 and 8. Exceedances of total or fecal coliform MCLs were also present in tap water samples collected from Study Areas 5, 7, and 8. Table 5-51 summarizes the tap water results collected from across the region that are from private wells or unknown sources.

At the Parcos and the NAVFAC-leased homes, the tap water source is a municipal water supply. As with all other tap water samples, arsenic concentrations were greater than the RSL in all samples, but all were less than the MCL. Trihalomethanes were detected at the three Parcos and NAVFAC-leased homes, but concentrations were only greater than the RSL at Parco Le Ginestre and the NAVFAC-leased homes; concentrations of trihalomethanes were less than the MCL in all samples. Chloroform was not detected

in tap water samples at Parco Eva, and was detected at concentrations greater than the RSL at Parco Le Ginestre and NAVFAC-leased homes; all chloroform concentrations were less than the MCL. PCE was not detected at Parcos Artemide and Eva; however, it was detected at Parco Le Ginestre and the NAVFAC-leased homes. It was only detected at concentrations greater than the RSL, but less than the MCL, at Parco Le Ginestre. SVOCs were not detected at Parco Eva and the NAVFAC-leased homes. SVOCs were detected at Parco Artemide and Parco Le Ginestre, but only at concentrations greater than the RSL at Parco Artemide. Pesticides and PCBs were not detected in any samples from the Parcos and the NAVFAC-leased homes. Nitrate concentrations, gross alpha and gross beta levels, and bacteriological parameters were all reported at levels less than their respective MCLs. Table 5-52 summarizes the tap water results from the Parcos and the NAVFAC-leased homes.

At the government sites, the tap water source is a municipal water supply. As with all other tap water samples, arsenic concentrations were greater than the RSL in all samples, but all were less than the MCL. Trihalomethanes were detected at all sites and concentrations were greater than the RSLs at all locations except the Lago Patria Receiver Site; concentrations of trihalomethanes were less than the MCL in all samples. Chloroform was detected in tap water samples at all sites except for JFC NATO. Where chloroform was detected, the concentrations were greater than the RSL at all locations except for Lago Patria Receiver Site; all chloroform concentrations were less than the MCL. PCE was only detected at Carney Park and the U.S. Consulate. PCE was detected at concentrations greater than the RSL, but less than MCL at these locations. SVOCs were only detected at Capodichino, but at concentrations less than the RSL. Pesticides and PCBs were not detected in any samples from the government sites. Nitrate concentrations and bacteriological parameters were all reported at levels less than their respective MCLs. Gross alpha and gross beta radiation were only reported at Gricignano Support Site and the U.S. Consulate; radiation levels were less than the MCLs. Table 5-53 summarizes the tap water results from the government sites.

VOCs	108-90-7	Chlorobenzene	--		
VOCs	75-00-3	Chloroethane	Yes	USEPA Integrated Risk Information System. August 2008. - http://cfpub.epa.gov/ncea/iris/index.cfm	Delayed ossification of skull bones was a critical effect used for development of the inhalation RfC.
VOCs	67-66-3	Chloroform	--		Chloroform was not identified as requiring immediate notification because because developmental toxicity was seen at concentrations higher than those associated with the critical effect.

TABLE 5-1

DEVELOPMENT, TERATOGENIC, AND MUTAGENIC CHEMICALS
PHASE I ENVIRONMENTAL TESTING SUPPORT ASSESSMENT
NSA NAPLES, ITALY

Class	Cas_No	Chemical	Immediately Notify if Concentration Exceeds RSL? (Applies to Developmental, Teratogenic, and/or Mutagenic Chemicals)[1]	Source of Information	Notes
VOCs	74-87-3	Chloromethane	--		
VOCs	156-59-2	cis-1,2-Dichloroethene	--		
VOCs	10061-01-5	cis-1,3-Dichloropropene	--		
VOCs	124-48-1	Dibromochloromethane	--		
VOCs	75-71-8	Dichlorodifluoromethane	--		
VOCs	100-41-4	Ethylbenzene	Yes	USEPA Integrated Risk Information System. August 2008. - http://cfpub.epa.gov/ncea/iris/index.cfm	Teratogenic effects (increased incidence of supernumerary and rudimentary ribs) was a critical effect used for development of the inhalation RfC. This was a developmental toxicty study, and effects were seen in rats.
VOCs	98-82-8	Isopropylbenzene	--		
VOCs	1634-04-4	Methyl tert-Butyl Ether	--		
VOCs	75-09-2	Methylene chloride	--		
VOCs	104-51-8	n-Butylbenzene	--		
VOCs	103-65-1	n-Propylbenzene	--		
VOCs	95-47-6	o-Xylene	--		
VOCs	135-98-8	sec-Butylbenzene	--		
VOCs	100-42-5	Styrene	--		
VOCs	98-06-6	tert-Butylbenzene	--		
VOCs	127-18-4	Tetrachloroethene	Yes	ATSDR, 2007. November 2007 Minimal Risk Levels - http://www.atsdr.cdc.gov/mrls/	Based on Developmental Endpoint for Acute Oral MRL
VOCs	108-88-3	Toluene	--		
VOCs	156-60-5	trans-1,2-Dchloroethene	--		
VOCs	10061-02-6	trans-1,3-Dichloropropene	--		
VOCs	79-01-6	Trichloroethene	Yes	ATSDR, 2007. November 2007 Minimal Risk Levels - http://www.atsdr.cdc.gov/mrls/	Based on Developmental Endpoint for Acute Oral MRL
VOCs	75-69-4	Trichlorofluoromethane	--		
VOCs	75-01-4	Vinyl chloride	Yes	USEPA Integrated Risk Information System. August 2008. - http://cfpub.epa.gov/ncea/iris/index.cfm	

TABLE 5-1

DEVELOPMENT, TERATOGENIC, AND MUTAGENIC CHEMICALS
PHASE I ENVIRONMENTAL TESTING SUPPORT ASSESSMENT
NSA NAPLES, ITALY

Class	Cas_No	Chemical	Immediately Notify if Concentration Exceeds RSL? (Applies to Developmental, Teratogenic, and/or Mutagenic Chemicals)[1]	Source of Information	Notes
VOCs	1330-20-7	Xylenes, total	--		

Notes:

RSL = Residential US EPA Regional Screening Level - http://epa-prgs.ornl.gov/chemicals/download.shtml

[1] For chemcials with "--" in the Immediately Notify Column, Immediately Notify if Concentrations Excceds:

(1) MCL or

(2) 10 x NonCancer RBL or

(3) 100 x Cancer RBL

10 x Noncancer RBL corresponds to HI of 10.

100 x Cancer RBL corresponds to cancer risk of 1E-04.

Radiological Parameters and Bacteria are not presented on this list.

6.0 SOIL GAS SAMPLING

All Phase I homes where soil and tap water were sampled were also sampled for soil gas. In addition, passive near-slab soil gas samples were also collected from the government-leased Parcos and the NAVFAC-leased homes. Passive near-slab soil gas samples were collected using the Gore™ Module, a passive sorbent-based sampler. Inside each module is an adsorbent structure engineered by Gore to collect a wide variety of volatile compounds. The module was buried in the ground at a depth of 18 inches and remained there for a 24-hour period. Upon retrieval of the samplers, the Modules were shipped to Gore for analysis.

The passive soil gas collection process measures chemical mass rather than concentration. Soil gas concentrations were estimated by Gore using the mass of chemical detected in combination with information obtained regarding the soil type in Naples and the Campania region. Although soil gas concentrations were estimated using default assumptions regarding soil characteristics, the information is not truly suitable for a robust quantitative risk assessment. The data collected via this process can be useful for screening purposes to determine if there is a potential for vapor intrusion. The complete set of Phase I soil gas data can be found in Appendix E.

The estimated soil gas concentrations were compared to values equal to 10 times the ambient air RSLs, which is the attenuation factor recommended by the USEPA for soil gas samples collected at a depth of less than five feet below ground surface (USPEA, 2002). The RSLs correspond to a cancer risk of 1×10^{-6} for carcinogens and a hazard index of 1.0 for noncarcinogens. For comparison to potential indoor air concentrations, the factor of 10 was applied to account for the attenuation of soil gas concentrations infiltrating through cracks, holes, or other openings in a building's foundation. Summaries of the soil data, separated by Study Area, Parco, and government-based property are presented in the following sections.

6.1 ECONOMY HOUSES

6.1.1 Study Area 1

Table 6-1 presents the VOCs that were detected in passive near-slab soil gas samples collected from Study Area 1. Descriptive statistics are presented in Table 6-2. There were 10 VOCs detected in 19 soil gas samples collected at Study Area 1. Pentadecane and tridecane were the most frequently detected VOCs, being detected in six soil gas samples. Undecane was detected in five soil gas samples. The remaining VOCs were only detected in one soil gas sample. Concentrations of chloroform (7.3 µg/m^3) and naphthalene (2.5 µg/m^3) exceeded the screening levels in one sample. Figure 6-1 shows the locations of the exceedances.

6.1.2 Study Area 2

No soil gas samples were collected from Study Area 2. Study Area 2 is within the downtown area of Naples; many residences are apartments in high-rise buildings and soil gas sampling was not relevant or not available due to accessibility.

6.1.3 Study Area 3

No VOCs were detected in the three passive near-slab soil gas samples collected from Study Area 3.

6.1.4 Study Area 4

Table 6-3 presents the VOCs that were detected in passive near-slab soil gas samples collected from Study Area 4. Descriptive statistics are presented in Table 6-4. Soil gas samples were collected from the properties in the study area. Seven VOCs were detected in only one of three soil gas samples at concentrations less than the screening levels.

6.1.5 Study Area 5

Table 6-5 presents the VOCs that were detected in passive near-slab soil gas samples collected from Study Area 5. Descriptive statistics are presented in Table 6-6. For the 30 soil gas samples that were collected from this study area, 10 VOCs were detected. Pentadecane and tridecane were the most frequently detected VOCs, being detected in seven soil gas samples. Undecane was detected in six samples, chloroform and toluene were detected in four samples, PCE was detected in three soil gas samples, and m+p-xylenes were detected in two samples. The remaining VOCs were only detected in one soil gas sample. Concentrations of chloroform (maximum concentration of 506 µg/m^3) exceeded its screening level in four samples, PCE (maximum concentration of 2,267 µg/m^3) exceeded its screening level in three samples, and TCE (maximum concentration of 25 µg/m^3) exceeded its screening level in one sample. Figure 6-2 shows the locations of the exceedances.

6.1.6 Study Area 6

Table 6-7 presents the VOCs that were detected in passive near-slab soil gas samples collected from Study Area 6. Descriptive statistics are presented in Table 6-8. Pentadecane was the most frequently detected VOC, being detected in four soil gas samples. PCE and tridecane were detected in two samples. The remaining VOCs were only detected in one soil gas sample. Concentrations of chloroform (maximum concentration of 7.0 µg/m^3), PCE (maximum concentration of 3,587 µg/m^3), and TCE

(maximum concentration of 33 µg/m^3) exceeded their screening levels in one sample. Figure 6-3 shows the locations of the exceedances.

6.1.7 Study Area 7

Table 6-9 presents the VOCs that were detected in soil gas samples collected from Study Area 7. Descriptive statistics are presented in Table 6-10. Benzene, PCE, and undecane were detected in one soil gas sample. Concentrations of PCE (maximum concentration of 4.7 µg/m^3) exceeded its screening level in one sample. Figure 6-4 shows the locations of the exceedance.

6.1.8 Study Area 8

Table 6-11 presents the VOCs that were detected in passive near-slab soil gas samples collected from Study Area 8. Descriptive statistics are presented in Table 6-12. For the 35 soil gas samples that were collected from this study area, eight VOCs were detected. Tridecane was the most frequently detected VOC, being detected in seven soil gas samples. Pentadecane, PCE, and undecane were each detected in six soil gas samples. The remaining VOCs were only detected in one soil gas sample. Concentrations of PCE (maximum concentration of 116 µg/m^3) exceeded its screening level in three samples and chloroform (maximum concentration of 4.8 µg/m^3) exceeded its screening level in one sample. Figure 6-5 shows the locations of the exceedances.

6.1.9 Study Area 9

Table 6-13 presents the VOCs that were detected in passive near-slab soil gas samples collected from Study Area 9. Descriptive statistics are presented in Table 6-14. PCE and tridecane were the only VOCs detected and were detected in only one soil gas sample. The detected concentration of PCE (7.2 µg/m^3) exceeded its screening level. Figure 6-6 shows the locations of the exceedance.

6.2 GOVERNMENT-LEASED PARCOS AND NAVFAC-LEASED HOMES

6.2.1 Parco Artemide

Table 6-15 presents the VOCs that were detected in passive soil gas samples collected from Parco Artemide. Descriptive statistics are presented in Table 6-16. For the 10 soil gas samples that were collected from this Parco, five VOCs were detected. PCE and TCE were the most frequently detected VOCs, being detected in two soil gas samples. 1,2,4-Trimethylbenzene, m+p-xylenes, and undecane were each detected in one soil gas sample. Concentrations of all VOCs were less than the screening levels in all samples.

6.2.2 Parco Eva

Table 6-17 presents the VOCs that were detected in passive soil gas samples collected from Parco Eva. Descriptive statistics are presented in Table 6-18. For the 10 soil gas samples that were collected from this Parco, five VOCs were detected. Pentadecane was the most frequently detected VOC, being detected in five soil gas samples. Tridecane was detected in four samples, undecane was detected in three samples, PCE was detected in two soil gas samples, and m+p-xylenes were detected in one sample. Concentrations of PCE (maximum concentration of 40.7 $\mu g/m^3$) exceeded its screening level in two samples. Figure 6-7 shows the locations of the exceedances.

6.2.3 Parco Le Ginestre

Table 6-19 presents the VOCs that were detected in passive soil gas samples collected from Parco Le Ginestre. Descriptive statistics are presented in Table 6-20. For the nine soil gas samples collected from this Parco, five VOCs were detected. PCE was the most frequently detected VOC, being detected in eight soil gas samples. Pentadecane was detected in seven samples, tridecane was detected in six samples, undecane was detected in three soil gas samples, and chloroform was detected in one sample. The remaining VOCs were only detected in one soil gas sample. Concentrations of PCE (maximum concentration of 704 $\mu g/m^3$) exceeded its screening level in six samples and chloroform (9.9 $\mu g/m^3$) exceeded its screening level in one sample. Figure 6-8 shows the locations of the exceedances.

6.2.4 NAVFAC-Leased Homes

Table 6-21 presents the VOCs that were detected in passive near-slab soil gas samples collected from the NAVFAC-leased homes. Descriptive statistics are presented in Table 6-22. For the six soil gas samples that were collected from the NAVFAC-leased homes, three VOCs were detected. Benzene and pentadecane were the most frequently detected VOCs, being detected in two soil gas samples. Undecane was detected in one soil gas sample. Concentrations of all VOCs were less than the screening levels in all samples.

6.3. SUMMARY

VOCs were detected in passive soil gas samples collected from all areas except for Study Area 3. No soil gas samples were collected from Study Area 2. Concentrations of VOCs were less than the screening levels in soil gas samples collected from Study Area 3, Parco Artemide, and the NAVFAC-leased homes. The areas with the most exceedances of VOC concentrations were Study Area 4, Study Area 8, and Parco Le Ginestre. Concentrations of PCE exceeded its screening level in 17 soil gas samples from seven areas. Chloroform was detected at concentrations exceeding its screening level in eight soil gas samples from five areas. Concentrations of TCE exceeded its screening level in two soil gas samples

from two areas. Naphthalene was detected at concentrations exceeding its screening level in one sample in one study area. The locations of all the exceedances are shown on Figure 6-9. A summary of the soil gas contaminants that exceeded the screening levels across the region is presented in Table 6-23.

PCE is the prevalent constituent detected in passive soil gas samples. Its presence suggests that PCE may be in the groundwater beneath the residences and migrating upward through the soil column. Scatterplots and categorical plots were developed to determine if there was any correlation between the concentrations of PCE in soil gas and tap water. Figure 6-10 shows that there is no correlation between the two media for those samples collected from a public water supply and Figure 6-11 shows that there is no correlation between the two media for those samples collected from a private well or unknown source. Moreover, Figures 6-12 (public water supply) and 6-13 (private well or unknown source) show that the concentration of PCE in tap water does not correlate well with the presence of PCE in soil gas, regardless of the source of the tap water.

7.0 IRRIGATION WELLS SAMPLING

Irrigation wells were sampled at Gricignano Support Site, Carney Park, Capodichino, and Parco Le Ginestre (Table 1-6). The wells were sampled because of the potential direct exposure residents may have with the irrigation well water. The samples collected from these irrigation wells were analyzed for VOCs, SVOCs, dioxins/furans, pesticides, PCBs, and metals, consistent with what was analyzed for in soil samples. Irrigation well samples were also analyzed for radiological parameters (gross alpha, gross beta, total uranium), anions, cyanide, and bacteriological parameters (total coliform, fecal coliform, fecal streptococcus, and agar colony count). The complete set of irrigation well data can be found in Appendix F.

As a conservative measure for screening, the data were compared to residential tap water RSLs and U.S. EPA MCLs, where applicable. In addition, the data were compared to the inhalation-only tap water RSL, 10 times the noncarcinogenic RSL, and 100 times the carcinogenic RSL. The RSLs correspond to a cancer risk of 1×10^{-6} for carcinogens and a hazard index of 1.0 for carcinogens.

Summaries of the data, separated by Parco and government-based property, are in the following sections.

7.1 PARCO LE GINESTRE

Table 7-1 presents the chemicals that were detected in the one irrigation well sample collected from Parco Le Ginestre. Descriptive statistics are presented in Table 7-2. VOCs, SVOCs, dioxins/furans, gross alpha and gross beta radioactivity, and total coliform were detected in the one irrigation well sample.

- Acetone, chloroform, and PCE were the only VOCs detected in the irrigation well sample. The concentrations of acetone, chloroform, and PCE were less than the RSLs and the MCLs for these substances.

- The TEQ concentration of 0.00068 ng/L exceeded the tap water RSL, but was less than the MCL.

- Bis(2-ethylhexyl)phthalate and butyl benzyl phthalate were the only SVOCs detected in the Parco Le Ginestre irrigation well sample. The detected concentration of bis(2-ethylhexyl)phthalate (27 ug/L) was greater than the tap water RSL and MCL.

- No pesticides or PCBs were detected in the irrigation well sample collected from Parco Le Ginestre.

- Sixteen inorganics were detected in the irrigation well sample collected from Parco Le Ginestre. Concentrations of arsenic (5.11 ug/L) and zinc (12,400 ug/L) exceeded the tap water RSLs, but were less than the MCLs. The concentrations of uranium (31.7 ug/L) exceeded its MCL.

- Gross alpha and gross beta radioactivity was detected in the irrigation well sample. The concentration of gross alpha (20.8 pCi/L) was greater than the MCL.

- Fecal coliform and fecal streptococcus were detected in the irrigation well sample. The MCL for these parameters is 0 CFU/100. Therefore, the coliform and streptococcus counts exceeded the MCL in the irrigation well sample.

- Chloride, fluoride, nitrate, and sulfate were detected in the irrigation well sample. The nitrate concentration of 293 mg/L exceeded the MCL and tap water RSL.

In summary, concentrations of bis(2-ethylhexyl)phthalate, nitrate, radiological parameters, and microbiological parameters exceeded RSLs or MCLs in the one irrigation well sample collected from the irrigation well at Parco Le Ginestre.

7.2 GRICIGNANO SUPPORT SITE

Table 7-3 presents the chemicals that were detected in the nine irrigation well samples collected from the irrigation wells at the Gricignano Support Site. Descriptive statistics are presented in Table 7-4. VOCs, dioxins/furans, chloride, fluoride, nitrate, nitrite, sulfate, gross alpha and gross beta radioactivity, and total coliform were detected in the irrigation well samples.

- Seven VOCs were detected in the irrigation well samples collected from Gricignano Support Site. 1,1,1-TCA, 1,1,-DCE, and PCE were detected frequently in the irrigation well samples. 1,1,1-TCA was detected in seven samples at concentrations ranging from 0.199 J ug/L to 1.08 ug/L, which were less than the tap water RSLs and MCL. 1,1-DCE was detected in six samples at estimated concentrations ranging from 0.132 ug/L to 0.1.21 ug/L, which were less than the tap water RSLs and MCL. PCE was detected in five samples at estimated concentrations ranging from 0.267 ug/L to 0.597 ug/L. The concentrations of PCE exceeded the tap water RSL in five samples but were less than the MCL in all samples. TCE was detected in one sample at an estimated concentration of 0.142 ug/L, which was less than the tap water RSL and MCL. The remaining VOCs were detected in only one sample at concentrations less than RSLs and the MCLs. Figure 7-1 shows the locations of the PCE exceedances.

- The TEQ concentrations ranged from 0.000106 ng/L to 0.00541 ng/L and exceeded the tap water RSL in three samples. The TEQ concentrations were less than the MCL in all samples.

- No SVOCs, pesticides, or PCBs were detected in the irrigation well samples collected from Gricignano Support Site.

- Eighteen inorganics were detected in the irrigation well samples collected from Gricignano Support Site. The concentrations of arsenic exceeded the tap water RSL in all nine samples. Arsenic was less than the MCL in all samples. The concentrations of lead exceeded its action level in one sample. Figure 7-2 shows the locations of the lead exceedances.

- Gross alpha radioactivity was reported in eight samples and gross beta was detected in nine samples. The concentrations of gross beta (maximum concentration of 60.3 pCi/L) exceeded the MCLs in six samples. Figure 7-3 shows the locations of the gross beta exceedances.

- Fecal streptococcus was detected in four samples. Total coliform was reported in five of the nine samples. The MCL for these parameters is 0 CFU/100. Therefore, the coliform and streptococcus counts exceeded the MCL in the irrigation well samples. Figure 7-4 shows the locations of the total coliform exceedances.

- Chloride, fluoride, nitrate, and sulfate were detected in all nine irrigation well samples and nitrate was detected in two samples. The concentrations of nitrate ranged from 68.4 mg/L to 117 mg/L and exceeded the MCL in 9 samples but were less than the tap water RSL in all samples. The concentrations of nitrite ranged from 2.42 mg/L to 6.34 mg/L and exceeded the MCL in one sample but were less than the tap water RSL in all samples. Figure 7-5 shows the locations of the nitrate and nitrite exceedances.

In summary, concentrations of PCE (five samples), dioxins/furans (three sample), arsenic (nine samples), lead (one sample), radiological parameters (six samples), microbiological parameters (five samples), nitrate (nine samples), and nitrite (one sample) exceeded RSLs or MCLs in the irrigation well samples collected from the irrigation wells at the Gricignano Support Site.

7.3 CAPODICHINO

Table 7-5 presents the chemicals that were detected in the one irrigation well sample collected from the irrigation well at Capodichino. Descriptive statistics are presented in Table 7-6. VOCs, dioxins/furans,

inorganics, gross alpha and gross beta radioactivity, chloride, fluoride, nitrate, and sulfate were detected in the irrigation well sample.

- Chloroform, cis-1,2-DCE, PCE, and TCE were the only VOCs detected in the irrigation well sample. The estimated concentrations of chloroform (0.27 ug/L), PCE (0.874 ug/L), and TCE (2.7 ug/L) exceeded the tap water RSLs, but were less than the MCLs.

- The TEQ concentration was 0.000114 ng/L, which was less than the tap water RSL and MCL.

- No SVOCs, pesticides, or PCBs were detected in the one irrigation well sample collected from Capodichino.

- Seventeen inorganics were detected in the one irrigation well sample collected from Capodichino. The detected concentration of arsenic (6.47 ug/L) exceeded the tap water RSL, but was less than the MCL.

- No radiological parameter exceeded the MCL.

- No microbiological parameter exceeded the MCL.

- Chloride, fluoride, nitrate, and sulfate were detected in the irrigation well sample. The nitrate concentration of 83.3 mg/L exceeded the MCL but was less than the tap water RSL.

In summary, concentrations of chloroform, PCE, TCE, arsenic, and nitrate exceeded the RSLs or MCLs in the irrigation well sample collected from the irrigation well at Capodichino.

7.4 CARNEY PARK

Table 7-7 presents the chemicals that were detected in the two irrigation well samples collected from the irrigation wells at Carney Park. Descriptive statistics are presented in Table 7-8. VOCs, dioxins/furans, inorganics, gross alpha and gross beta radioactivity, total coliform, chloride, fluoride, nitrate, and sulfate were detected in the irrigation well samples.

- Chloroform and PCE were the only VOCs detected in the irrigation well samples. Chloroform and PCE were detected in one irrigation well sample at estimated concentrations of 5.58 ug/L and 0.341 ug/L, respectively, which exceeded the tap water RSLs, but were less than the MCLs.

- The TEQ concentrations ranged from 0.00057 ng/L to 0.000901 ng/L and exceeded the tap water RSL in one sample. The TEQ concentrations were less than the MCL in both samples.

- No SVOCs, pesticides, or PCBs were detected in the two irrigation well samples collected from Carney Park.

- Sixteen inorganics were detected in the irrigation well samples collected from Capodichino. The detected concentration of arsenic exceeded the tap water RSL and MCL in both samples.

- No radiological parameter exceeded the MCL.

- Fecal coliform, fecal streptococcus, and total coliform were detected in one irrigation well sample. The MCL for these parameters is 0 CFU/100. Therefore, the coliform and streptococcus counts exceeded the MCL in the irrigation well sample.

- Chloride, fluoride, nitrate, and sulfate were detected in the two irrigation well samples. The concentrations of nitrate ranged from 30.7 mg/L to 69 mg/L and exceeded the MCL in one sample but were less than the tap water RSL in both samples.

In summary, concentrations of chloroform (one sample), PCE (one sample), dioxins/furans (one sample), arsenic (two samples), microbiological parameters (one sample), and nitrate (one sample) exceeded the RSLs or MCLs in the two irrigation well samples collected from the irrigation well at Carney Park.

7.5 SUMMARY

In the irrigation well samples collected from the four government-based properties as part of this Phase I investigation, arsenic exceeded its RSL in all samples and exceeded its MCL in the samples collected from Carney Park. Chloroform was detected at concentrations greater than its RSL, but less than the MCL, in samples collected from Capodichino and Carney Park. PCE was detected at concentrations greater than tap water RSLs at all locations but Parco Le Ginestre, but was not detected at concentrations greater than the MCL. Dioxins/furans were detected at concentrations greater than the RSL at all locations except Capodichino, but were less than the MCL. SVOCs (phthalates) were only detected at concentrations greater than RSLs in the one sample collected from Parco Le Ginestre. Pesticides and PCBs were not detected in any samples. Nitrates were detected at concentrations greater than MCLs in all areas. Irrigation well samples also had exceedances of the gross alpha or gross beta MCLs from Parco Le Ginestre and Gricignano Support Site. Exceedances of total or fecal coliform MCLs

were also present in irrigation well samples collected from all areas but Capodichino. Table 7-9 summarizes the irrigation well results from across the region.

8.0 CONCLUSIONS AND RECOMMENDATIONS

8.1 CONCLUSIONS

The principal objective of this Phase I ETSA was to identify and characterize potential health impacts to United States military and civilian personnel and their families residing in the Naples area of Campania. The results of the investigation were intended to be used in a screening evaluation to determine whether exposure to ambient air, soil, tap water, and indoor air potentially pose unacceptable risks, based on United States EPA guidelines and if additional sampling is needed to evaluate overall risk to residents. A secondary objective of this Phase I activity was to identify technical, logistical, and procedural issues for consideration in the aspects that should be included, excluded, or revised in progressing to a larger second phase endeavor. The following sections present the conclusions and recommendations that were identified from the Phase I ETSA, categorized by the various environmental media.

8.1.1 Air Sampling Conclusions

The results of the Phase I air sampling indicated that concentrations of air contaminants detected across the region are typical of what is detected in United States urban environments. Many of the chemicals that were detected in air at concentrations greater than screening levels can be attributed to automobile engine exhaust and industrial emissions. Moreover, no significant correlation could be drawn between air contaminant concentrations and noted observations of burning.

There were no violations of the PM-10 24-hour NAAQS standard (150 ug/m^3) during the Phase I sampling period of July 7, 2008 to August 8, 2008. Metals, such as arsenic, cadmium, chromium, and cobalt, were detected across the region at levels greater than air RSLs. Several VOCs, such as acetaldehyde, acrolein, benzene, ethyl benzene, chlorinated hydrocarbons, and 1,2-dichloropropane were detected at concentrations greater than air RSLs. Formaldehyde was widely detected at levels greater than its air RSL across the region. Two carcinogenic PAHs, benzo[a]pyrene and dibenzo[a,h]anthracene, were the only SVOCs detected at levels greater than air RSLs. Dioxins/furans were detected in air samples at concentrations greater than air RSLs in all study areas except for JFC NATO and Carney Park. Pesticides were infrequently detected and PCBs and mercury were not detected in any samples. Although there were constituents detected at concentrations greater than air RSLs, the concentrations were comparable to concentrations detected in the air in urban environments in the United States and would not require mitigation under United States environmental regulations **(Table 3-12)**.

These concentrations have been compared to urban concentrations identified in the toxicological profiles for individual chemicals prepared by the Agency for Toxic Substances and Disease Registry (ATSDR)

and concentrations identified in selected United States cities (**Table 8-1**). Norfolk, VA and San Diego, Ca were selected as cities for comparison because of the presence of the Navy in these two cities. Louisville, KY was selected because an extensive air study and risk assessment has recently been conducted there. New York City was selected because of its similarity to Naples, Italy with regards to having a large population, having heavy traffic, being a port city, and being in an industrial area. The chemicals being compared in the table are those chemicals that exceeded screening levels. Metals and aldehydes concentrations from the Naples study are comparable to what is seen in the selected cities. Concentrations of the chlorinated VOCs, benzene, and ethylbenzene are slightly greater than what was detected in the selected cities, but are less than two times the maximum reported concentrations for these cities. 1,2-Dichloropropane is the only chemical with a concentration that clearly separates itself from the Norfolk concentration and the ATSDR urban background level. Although some of the Naples chemical data may exceed the city concentrations, it should be noted that this comparison is only based on data collected during the Phase I sampling period of July 7, 2008 to August 8, 2008, which is likely to be the month with the highest concentrations of contaminants.

8.1.2 Soil Sampling Conclusions

In surface soil samples, arsenic was detected at concentrations greater than its residential soil RSL in all samples. However, the levels that were detected across the region are most likely naturally occurring and can be attributed to the volcanic soil (which exists in the areas included in this Phase I ETSA because of proximity to Mt. Vesuvius) (Cicchella, et al. 2005). Carcinogenic PAHs and dioxins/furans were the only other constituents that were detected in soil at concentrations greater than residential soil RSLs. However, these concentrations are consistent with anthropogenic background levels typically found in urban environments (ATSDR 1996, ATSDR 1998) and would not require mitigation under US EPA regulations.

8.1.3 Tap Water Conclusions

Tap water data were analyzed in terms of its source: municipal water supply or private well/unknown source. For tap water samples collected from a municipal water supply, arsenic exceeded its tap water RSL in all samples and exceeded its MCL in one sample in Study Area 8. For tap water samples collected from a private well or unknown source, arsenic also exceeded its tap water RSL in all samples and exceeded its MCL in samples collected from Study Areas 5 and 8. As expected in samples collected from residences connected to a municipal water supply because of water treatment (e.g., chlorine), trihalomethanes were widely detected at levels greater than their RSLs, but were always less than its MCL. For those samples collected from residences connected to a private well or unknown source, trihalomethanes were detected less frequently and were not widely detected at levels greater than their RSLs. Trihalomethane concentrations did not exceed the MCL in any of the private well tap water

samples. PCE was frequently detected in tap water samples collected from across the area at levels greater than its tap water RSL. However, PCE concentrations only exceeded its MCL in tap water samples that were from a private well in Study Areas 7 and 8. PCE concentrations were detected at trace levels in tap water samples believed to be collected from municipal water supplies. Nitrate was detected at concentrations greater than its MCL in tap water samples in Study Areas 6, 7, and 8 in samples believed to be collected from municipal water supplies and from private wells. Nitrate was detected at concentrations greater than its MCL in Study Area 5 only in tap water samples from a private well. Radiological activity (gross alpha and gross beta) was detected at levels greater than MCLs in Study Areas 6, 7, and 8 for water samples from a municipal water supply and in Study Areas 7 and 8 for water samples from a private well or unknown source. Total and fecal coliform were present in municipal source tap water samples collected from Study Areas 6, 7, and 8 and private well tap water samples collected from Study Areas 5, 7, and 8. SVOCs (phthalates) were infrequently detected in tap water samples and pesticides and PCBs were never detected in any tap water sample, regardless of source. The results for samples collected from homes on the economy are summarized in **Table 5-50** (municipal water supply) and **Table 5-51** (private wells/unknown sources).

Tap water samples were also collected from Parcos, NAVFAC-leased homes, and government-based sites across the region. All of the samples collected from these sites were connected to a municipal water supply. Arsenic concentrations in all samples were greater than the tap water RSL, but were less than the MCL. Trihalomethanes were widely detected at concentrations greater than RSLs, but were less than the MCL. PCE was detected less frequently; it was detected at concentrations greater than its RSL, but less than its MCL at Parco Le Ginestre, NAVFAC-leased homes, Carney Park, and the United States. Consulate. SVOCs were either not detected or were detected at levels less than their RSLs at these sites. Pesticides and PCBS were not detected in any tap water samples from these sites. Nitrate and radiological activity were not detected at levels greater than MCLs in any sample. Total and fecal coliform were not detected in any tap water samples from these sites. The results for samples collected from Parcos and NAVFAC-leased homes are summarized in **Table 5-52**. The results for samples collected from government-based sites are summarized in **Table 5-53**.

Italian Law (D.Lgs. 31/2001) establishes water quality criteria, identified as MCLs, which are mostly consistent with US EPA MCLs. Of relevance to this investigation are the MCLs for PCE and TCE. Whereas the United States EPA MCL for PCE and TCE are each 5 µg/L, the Italian MCL is set at 10 µg/L for the sum of the two constituents' concentrations. Also of relevance to this investigation is the MCL for trihalomethanes. The Italian MCL for trihalomethanes is 30 µg/L, more stringent than United States EPA's MCL of 80 µg/L. Five residences had concentrations exceeding the Italian MCL for PCE and TCE; one residence was located in Study Area 5 and four residences were located in Study Area 8. However,

all exceedances of the Italian MCL for PCE and TCE were solely attributable to PCE. No residences exceeded the more stringent Italian MCL for trihalomethanes.

Overall, arsenic was detected in all samples and could be indicative of naturally occurring background (DeVivo and Lima, 2008).

8.1.4 Passive Soil Gas Sampling Conclusions

In passive soil gas samples, VOCs were detected in all areas except for Study Area 3. Concentrations of VOCs were less the screening levels in soil gas samples collected from Study Area 4, Parco Artemide, and the NAVFAC-leased homes. PCE was the prevalent constituent detected at concentrations greater than its screening level, but its source is unknown. The data suggest that no correlation can be drawn between the presence or concentrations of PCE in tap water with the presence or concentrations of PCE in soil gas. Therefore, the presence of PCE in tap water does not indicate a conclusion of a potential vapor intrusion problem. However, soil gas data is a better indicator than groundwater data for determining the likelihood for vapor intrusion. **Table 6-23** provides a summary of the passive soil gas results that were collected in this investigation.

8.1.5 Irrigation Well Sampling Conclusions

Water samples were also collected from irrigation wells at Parco Le Ginestre, Gricignano Support Site, Capodichino, and Carney Park. As seen with all irrigation well samples, arsenic was detected at concentrations greater than its RSL, but less than its MCL. PCE was detected at concentrations greater than its RSL at all locations except for Parco Le Ginestre, but less than its MCL. SVOCs (phthalates) were detected at concentrations greater than RSLs in the sample collected from Parco Le Ginestre. Nitrates were detected at concentrations greater than MCLs in samples collected from all areas. Radiation levels (gross alpha and gross beta) exceeded MCLs at Parco Le Ginestre and Gricignano Support Site. Total and fecal coliform were detected in samples collected from all locations except for Capodichino. Pesticides and PCBs were not detected in any samples.

8.2 RECOMMENDATIONS

8.2.1 Revisions to Air Sampling

The results of the air sampling indicated that contaminant air concentrations are consistent with what is typically detected in United States urban environments (**Table 3-12, Table 8-1**). Pesticides were infrequently detected and PCBs and mercury were not detected in any sample. Benzo[a]pyrene and dibenzo[a,h]anthracene were the only SVOCs detected at levels greater than air RSLs. Based on what was observed during Phase I, Phase II air sampling has continued throughout the region, with samples

being collected every nine days at the nine air sampling stations in accordance with the approved Quality Assurance Project Plan (QAPP). It is recommended that there be no change in the analyte list for subsequent air sampling. It is also recommended that sampling be increased to a frequency of collecting samples every six day.

8.2.2 Revisions to Surface Soil Sampling

Arsenic, carcinogenic PAHs, and dioxins/furans were the only constituents detected in soil at concentrations greater than residential soil RSLs. A statistical analysis of the soil data collected in this Phase I study has shown that a limited number of additional samples is needed in two study areas to have the confidence to avoid concluding incorrectly that the site is not significantly contaminated with carcinogenic PAHs and dioxins/furans (**Appendix G**). Eight additional surface soil samples need to be collected in Study Area 4 and seven additional surface soil samples need to be collected in Study Area 6. These additional samples will be analyzed for the same suite of analytes as other surface soil samples collected during this Phase I ETSA. No additional surface soil samples are needed for the other study areas.

People are currently exposed to contaminants above the RSLs in surface soils in the Naples Study Areas. These levels are consistent with background concentrations and do not indicate elevated contamination from poor waste disposal practices. For many of these pathways, the Navy has determined that these exposures represent no significant health threat because contact with the contaminants is negligible or infrequent.

8.2.3 Revisions to Tap Water Sampling

SVOCs (phthalates) were infrequently detected in tap water samples and pesticides and PCBs were never detected in any tap water sample, regardless of the known water source (municipal or well/unknown). Because of the absence of pesticides and PCBs in the tap water, subsequent tap water samples collected in the Phase II ETSA will not be analyzed for pesticides and PCBs. A statistical analysis of the tap water SVOC data indicated that sufficient data have been collected to have confidence to avoid incorrectly concluding that the tap water concentrations of SVOCs are consistently less than RSLs when they may actually exceed RSLs (**Appendix G**). Therefore, it is recommended that subsequent tap water sampling exclude these groups of analytes in future sampling efforts.

Arsenic was the only metal detected at levels greater than RSLs, but concentrations are consistent with naturally occurring background conditions. Gross alpha and beta have been detected at levels greater than MCLs; therefore, speciation into specific isotopes would be required if radiation levels exceed their MCLs for subsequent Phase II tap water sampling. If the gross alpha MCL of 15 pCi/L is exceeded in

Phase II samples, the uranium and combined radium-226/228 concentrations will be determined and compared to their MCLs. If any of these measurements exceed their respective MCLs, a risk assessment will be conducted with the data. If the gross beta screening value of 8 pCi/L, after subtracting out activity associated with potassium-40 (K-40), is exceeded in Phase II samples, the beta activity associated with strontium-90 (Sr-90) and other radionuclides will be determined. K-40 activity is subtracted from the gross beta activity because it occurs naturally in tap water and does not accumulate in the body. If the concentration, or combined concentration of radionuclides is greater than the MCL dose of 4 mrem per year, a risk assessment will be conducted.

The municipal water supply does not contain backflow prevention as a means to ensure no illegal well connections. Because of the uncertainty associated with knowing whether a residence is solely connected to a municipal water supply, it would be prudent to continue sampling the tap water from homes presumed to be connected to a municipal water supply.

8.2.4 Revisions to Soil Gas Sampling

The soil gas results that were collected using passive methods indicated that VOCs were present and suggest that there is some potential for vapor intrusion from subsurface soil gas. Passive methods provided qualitative results that better predicted presence or absence of soil gas contaminants. Therefore, active sub-slab soil gas sampling is recommended in subsequent sampling in lieu of passive sampling to provide quantitative data.

8.2.5 Revisions to Irrigation Well Sampling

Irrigation well data provides an indication of what contaminants are present in groundwater. Consequently, irrigation well data is a better indicator of what exists in the subsurface than tap water data. Moreover, irrigation well data (groundwater data) provides a better potential for determining a correlation between groundwater and soil gas concentrations. In cases where additional sampling may be needed to delineate contamination, it is recommended that water samples be collected from irrigation wells in conjunction with active soil gas samples, if possible.

8.3 SUMMARY

The NSA Naples Phase I ETSA provided valuable insight into the potential exposure of Navy personnel and their dependents living the Naples area of Campania. Phase I gathered environmental data and compared the data to established risk screening levels and criteria used in the United States to determine if further study is warranted. Screening levels and criteria provide a means of identifying constituents for further evaluation.

The air data indicates that contaminant concentrations are consistent with what is typically detected in urban environments in the United States. 1,2-Dichloropropane is the only constituent that appears to be at levels greater than what is seen in urban environments. The air data in this report only reflects a 30-day period. Additional sampling over the course of a year will provide greater insight into the nature of air contamination in the Naples area.

In surface soil samples collected as part of this investigation, only arsenic, carcinogenic PAHs, and dioxins were detected at concentrations greater than risk-based screening levels. However, the arsenic concentrations are consistent with what is considered to be naturally occurring background in the Naples area. Concentrations or carcinogenic PAHs and dioxins are consistent with what is considered attributable to anthropogenic sources. The data that have been collected as part of this Phase I ETSA in seven of the nine study areas is sufficient to draw conclusions about protection of human health. Additional surface soil data needs to be collected in Study Areas 4 and 6 to achieve the same level of confidence for decision making that exists in the other seven study areas. The additional soil samples will be analyzed for the same list of parameters.

In tap water samples collected from locations believed to be connected to a municipal water supply, the preponderance of the results were satisfactory. Some municipal water samples had concentrations of nitrates, bacteriological parameters, and radiation that exceeded MCLs. The presence of these contaminants could have been attributable to blending with a private well or could have been the result of not cleaning a water storage tank. PCE was also detected in tap water samples believed to be connected to a municipal water supply; its presence is most likely attributable to blending. Only in tap water samples collected from private wells was PCE ever detected at concentrations greater than its MCL. SVOCs (phthalates) were infrequently detected and pesticides and PCBs were never detected in tap water samples. Tap water sampling will continue in Phase II of this investigation, but SVOCs, pesticides, and PCBs will be eliminated from the analyte list.

Passive near-slab soil gas sampling has revealed the presence of VOCs in approximately 15 percent of the samples. PCE is the contaminant that was detected with the greatest frequency at concentrations greater than its risk-based screening level. The presence of PCE in soil gas in concert with the presence of PCE in tap water samples has warranted the collection of active soil gas samples during the Phase II investigation.

Irrigation well data has revealed the presence of bacteriological parameters, radiological parameters and nitrates at levels greater than MCLs. PCE was detected at concentrations greater than risk-based

screening levels. However, irrigation well data (groundwater data) will only be collected during the Phase II investigation for purposes of delineating contamination, if deemed necessary.
