Appendix C.2
Soil Background Analysis

Soil Background Analysis

Per Navy Guidance various statistical techniques were used to determine if the concentrations are most likely from background concentrations. First, the percentage of detected concentrations was computed. Basic summary statistics of the data were also computed. Next, it was determined if the data followed a normal or a log-normal distribution using histograms, boxplots, normal probability plots, and the Shapiro Wilk Test. A histogram is a visual representation of the data collected into groups which allows for a visual method for identifying the underlying distribution. If the data is roughly symmetric and bell-shaped the data most likely follows a normal distribution. A boxplot displays several percentiles of the data set (minimum, 25th percentile, median, 75th percentile, and maximum). The length of the central box indicates the spread of the data while the length of the whiskers shows the breadth of the tails of the distribution. If the upper box and whisker are approximately the same length as the lower box and whisker then the data are distributed symmetrically. If the upper box and whisker are longer than the lower box and whisker, then the data are 4ith5 skewed. If the upper box and whisker are shorter than the lower box and whisker, then the data are left skewed (Data Quality Assessment: Statistical Methods for Practitioners). The normal probability plot is a visual method to roughly determine how well the data set follows the normal distribution. A normal probability plot graphs the quantiles of the data set against the quantiles of the standard normal distribution. If the graph is approximately linear then the data set are roughly normally distributed. Non-normally distributed data will have deviations from linearity. The Shapiro Wilk Test is recommended by the EPA's *Data Quality Assessment: Statistical Methods for Practitioners* as one of the most powerful tests for normality. The Shapiro Wilk test is similar to computing a correlation between the quantiles of the standard normal distribution and the ordered values of the data set. The hypothesis assumes that the data is roughly normally distributed. If the p-value for the test is between 0.05 and 0.01 the data roughly follow the normal distribution; if the p-value is greater than 0.05 the data follows normal distribution. If the data was less than 15% detected then no formal conclusions on the distribution of the data were concluded. After the data distribution was determined the summary statistics, histograms, boxplots, and normal probability plots were examined to see if there are any obvious breaks in linearity or changes in slope on the probability plot and potential outliers or extreme values that would indicate that these concentrations were not likely from background concentrations.

Arsenic

For the statistical background analysis averages were used for duplicate results and rejected concentrations were removed from the background analysis.

Table 1 shows the counts of detected and non-detected concentrations for Arsenic, along with the percentage of detected results.

Table 1
Soils
Counts of Detected and Non-detected Concentrations

	Arsenic	
	N	D
	0	191
Percent Detect	100	

N = Non-detected result
D =Detected result

The minimum, 1st quartile, median, mean, 3rd quartile, and maximum concentration were computed for each chemical. Table 2 shows these summary statistics.

Table 2
Soil

Table 4
Soil
Background Concentrations

	Background Concentrations
Arsenic	Most Likely All Background

The data is normally distributed. From the histogram and boxplot it can be seen that the data is roughly symmetric. The Normal Probability Plot shows no clear break in concentrations. Therefore, the arsenic concentrations are most likely all background concentrations.

Table 10
Soil
Background Concentrations

	Background Concentrations (mg/kg)
BAP equivalent	0.05

From the histogram it can be seen that the majority of the data ranges from 0 to 0.05 mg/kg. From the normal probability plot and boxplot it can be seen that there are seven extreme concentrations that are separated from the rest of the data. These concentrations are above 0.047294 mg/kg. Therefore, BAP equivalent concentrations equal to or less than 0.047294 mg/kg are background concentrations.

Descriptive Statistics were computed for each chemical. Table 8 shows the minimum, 1st quartile, median, mean, 3rd Quartile, and maximum concentration for each chemical.

Table 14
Soil
Descriptive Statistics

	Minimum	1st Quartile	Median	Mean	3rd Quartile	Maximum
TEQ	0.00135	0.2396	0.52080	1.131	0.987	16.14

Table 15
Soil
Data Distribution Conclusions

Parameter	Distribution
TEQ	Nonparametric

Table 16
Soil
Background Concentrations

	Background Concentrations (mg/kg)
TEQ	5.44115 ng/kg

From the histogram, normal probability plot, and boxplot a separation of concentrations can be seen around 5ng/kg. From the normal plot and the boxplot it appears that the six highest concentrations are separated from the rest of the data. Therefore, TEQ concentrations in soil less than or equal to 5.44115 ng/kg are most likely background concentrations.

Appendix D.2
Tap Water Background Analysis

Water Background Analysis

Per Navy Guidance various statistical techniques were used to determine if the concentrations are most likely from background concentrations. First, the percentage of detected concentrations was computed. Basic summary statistics of the data were also computed. Next, it was determined if the data followed a normal or a log-normal distribution using histograms, boxplots, normal probability plots, and the Shapiro Wilk Test. A histogram is a visual representation of the data collected into groups which allows for a visual method for identifying the underlying distribution. If the data is roughly symmetric and bell-shaped the data most likely follows a normal distribution. A boxplot displays several percentiles of the data set (minimum, 25^{th} percentile, median, 75^{th} percentile, and maximum). The length of the central box indicates the spread of the data while the length of the whiskers shows the breadth of the tails of the distribution. If the upper box and whisker are approximately the same length as the lower box and whisker then the data are distributed symmetrically. If the upper box and whisker are longer than the lower box and whisker, then the data are 4ith5 skewed. If the upper box and whisker are shorter than the lower box and whisker, then the data are left skewed (Data Quality Assessment: Statistical Methods for Practitioners). The normal probability plot is a visual method to roughly determine how well the data set follows the normal distribution. A normal probability plot graphs the quantiles of the data set against the quantiles of the standard normal distribution. If the graph is approximately linear then the data set are roughly normally distributed. Non-normally distributed data will have deviations from linearity. The Shapiro Wilk Test is recommended by the EPA's *Data Quality Assessment: Statistical Methods for Practitioners* as one of the most powerful tests for normality. The Shapiro Wilk test is similar to computing a correlation between the quantiles of the standard normal distribution and the ordered values of the data set. The hypothesis assumes that the data is roughly normally distributed. If the p-value for the test is between 0.05 and 0.01 the data roughly follow the normal distribution; if the p-value is greater than 0.05 the data follows normal distribution. If the data was less than 15% detected then no formal conclusions on the distribution of the data were concluded. After the data distribution was determined the summary statistics, histograms, boxplots, and normal probability plots were examined to see if there are any obvious breaks in linearity or changes in slope on the probability plot and potential outliers or extreme values that would indicate that these concentrations were not likely from background concentrations.

For the water background analysis all water data (TW, PVC, and IW) was used for the statistical calculations. There are two underlying populations of water data that were collected, water from a public source and water from a private well or unknown water source. Therefore the water data was broken into two categories public source versus unknown or private wells for the analysis. Re-samples were removed from the analysis and only the original sample was used for the statistical calculations. Averages were used for duplicate results and rejected concentrations were removed from the data set. A proxy of ½ the detection limit was used for concentrations reported below the detection limit.

Public Source

Arsenic

Table 1 shows the counts of detected and non-detected concentrations for arsenic, along with the percentage of detected results.

Table 1
Water
Public Source
Counts of Detected and Non-detected Concentrations

	Arsenic	
	N	D
	0	162
Percent Detect	100	

N = Non-detected result
D =Detected result

The minimum, 1st quartile, median, mean, 3rd quartile, and maximum concentration were computed. Table 2 shows these summary statistics.

Table 2
Water
Public Source
Descriptive Statistics

	Minimum	1st Quartile	Median	Mean	3rd Quartile	Maximum
Arsenic	0.57	2.8	3.595	4.7	4.2	118

Table 3
Water
Public Source
Shapiro Wilk Test Results

	Normal		Log Normal		Data Distribution
	W	P-value	W	P-value	
Arsenic	0.1716	< 2.2e-16	0.7817	2.885e-14	Nonparametric

Table 4
Water
Public Source
Background Concentrations

	Background Concentrations
Arsenic	Less than or Equal to 11.6ug/L

From both the raw data and the log-transformed data it can be seen that the two highest concentrations are separated from the rest of the data. On both probability plots these two concentrations are separated from the rest of the data. Both histograms and both boxplots show these two concentrations as extreme concentrations separated from the rest of the data. Therefore background arsenic concentrations in public water source are most likely equal to or less than 11.6ug/L.

Table 8
Water
Public Source
Background Concentrations

Parameter	Background Level
Gross Alpha	Equal to or Less than 3.5ug/L

From the raw data there are eight concentrations that are separated from the rest of the data. From the normal probability plots there is a change in slope between the eight highest concentrations and the rest of the data. From the histogram and boxplot of the raw data the separation of the eight highest concentrations is seen. Therefore background Gross Alpha concentrations in public water source are most likely equal to or less than 3.5 PCI/L.

The minimum, 1st quartile, median, mean, 3rd quartile, and maximum concentration were computed for each chemical. Table X shows these summary statistics.

Table 10
Water
Public Source
Descriptive Statistics

	Minimum	1st Quartile	Median	Mean	3rd Quartile	Maximum
Gross Beta	2.15	2.6	2.95	8.8	10.2	155.7

The data was then examined to determine if it followed a normal or lognormal distribution. Histograms, boxplots, normal probability plots, and the Shapiro Wilk Test were constructed to see if the data follows a normal distribution.

Table 11
Water
Public Source
Data Distribution Conclusions

	Normal		Lognormal		Data Distribution
	W Statistic	P-Value	W Statistics	P-Value	
Gross Beta	0.428	< 2.2e-16	0.8156	9.966e-14	Nonparametric

Table 12
Water
Public Source
Background Concentrations

Parameter	Background Level
Gross Beta	Equal to or Less than 20.8ug/L

From the raw and log-transformed data there are ten concentrations that are separated from the rest of the data. From the normal probability plots there is a change in slope between the ten highest concentrations and the rest of the data. From the histogram and boxplot of the raw data the separation of the ten highest concentrations is seen. Therefore background Gross Beta concentrations in public water source are most likely equal to or less than 20.8 PCI/L.

Tetrachloroethene	0.1916	< 2.2e-16	0.4763	< 2.2e-16	Nonparametric

Table 20
Water
Public Source
Background Concentrations

Parameter	Background Level
Tetrachloroethene	Equal to or Less than 0.57ug/L

From the raw data there are five concentrations separated from the rest of the data; this can be seen on the histogram, normal probability plot, and boxplot. From the normal probability plot it can be seen that these concentrations follow a different slope then the rest of the data. Therefore Tetrachloroethene concentrations less than or equal to 0.57ug/L are most likely background concentrations in public source water.

Data Distribution Conclusions

Parameter	Normal		Lognormal		Data Distribution
	W Statistic	P-Value	W Statistic	W Statistic	
Arsenic	0.504	1.04E-12	0.8521	4.811e-06	Nonparametric
Arsenic w/o Extremes	0.9603	0.076			Normal

Table 24
Water
Private or Unknown Source
Background Concentrations

Parameter	Background Level
Arsenic	Equal to or Less than 8.4ug/L

The raw concentrations showed a separation from the five highest concentrations and the rest of the data. This separation can be seen on both normal probability plots, both histograms, and both boxplots. The data without the five highest concentrations is normally distributed. The boxplot is roughly symmetric with no extreme concentrations. The normal probability plot does not show any separation of concentrations or changes in slope. Therefore background arsenic concentrations in private wells or unknown water sources are most likely less than or equal to 8.4ug/L.

N = Non-detected result
D =Detected result

The minimum, 1st quartile, median, mean, 3rd quartile, and maximum concentration were computed. Table 26 shows these summary statistics.

Table 26
Water
Private or Unknown Source
Descriptive Statistics

	Minimum	1st Quartile	Median	Mean	3rd Quartile	Maximum
Gross Alpha	0.55	1.9	4.1	4.675	5.68	20.8

The data was then examined to determine if it followed a normal or lognormal distribution. A summary of the results appear in Table 27.

Table 27
Water
Private or Unknown Source
Data Distribution Conclusions

Parameter	Normal		Lognormal		Data Distribution
	W Statistic	P-Value	W Statistic	W Statistic	
Gross Alpha	0.7717	1.9E-08	0.9085	0.0002149	Nonparametric
Gross Alpha w/o Extremes	0.9471	0.012			Roughly Normal

Table 28
Water
Private or Unknown Source
Background Concentrations

Parameter	Background Level
Gross Alpha	Equal to or Less than 10.3 PCI/L

The gross alpha concentrations are normally distributed without the three highest concentrations. The histogram is roughly bell-shaped (excluding the non-detects) and the boxplot is roughly symmetric with a slightly longer right tail. The normal probability plot shows no change in slope. Therefore background gross alpha concentrations from private wells or unknown water sources are less than or equal to 10.3PCI/L.

The minimum, 1st quartile, median, mean, 3rd quartile, and maximum concentration were computed. Table 30 shows these summary statistics.

Table 30
Water
Private or Unknown Source
Descriptive Statistics

	Minimum	1st Quartile	Median	Mean	3rd Quartile	Maximum
Gross Beta	2.3	27.44	48.11	40.84	55.33	75.4

The data was then examined to determine if it followed a normal or lognormal distribution. Histograms, boxplots, normal probability plots, and the Shapiro Wilk Test were constructed to see if the data followed a normal distribution. A summary of the results appear in Table 31.

Table 31
Water
Private or Unknown Source
Data Distribution Conclusions

Parameter	Normal		Lognormal		Data Distribution
	W Statistic	P-Value	W Statistic	W Statistic	
Gross Beta	0.8675	7.8E-06	0.6838	2.839e-10	Nonparametric

Table 32
Water
Private or Unknown Source
Background Concentrations

Parameter	Background Level
Gross Beta	Equal to or Less than 38.4 PCI/L

There is an inflection point on the normal probability plot of the log-transformed data around 3.5PCI/L (40PCI/L raw concentration). This inflection point is also on the raw data normal probability plot. Therefore background gross beta concentrations in private wells or unknown water sources are less than or equal to 38.4PCI/L.

The minimum, 1st quartile, median, mean, 3rd quartile, and maximum concentration were computed. Table 38 shows these summary statistics.

Table 38
Water
Private or Unknown Source
Descriptive Statistics

	Minimum	1st Quartile	Median	Mean	3rd Quartile	Maximum
Tetrachloroethene	0.035	0.035	0.43	8.786	6.808	94.2

The data was then examined to determine if it followed a normal or lognormal distribution. A summary of the results appear in Table 39.

Table 39
Water
Private or Unknown Source
Data Distribution Conclusions

Parameter	Normal		Lognormal		Data Distribution
	W Statistic	P-Value	W Statistic	W Statistic	
Tetrachloroethene	0.5557	3.124e-13	0.8707	3.237e-06	Nonparametric

Table 40
Water
Private or Unknown Source
Background Concentrations

Parameter	Background Level
Tetrachloroethene	Equal to or Less than 17.2 ug/L

A separation of concentrations can be seen around 20ug/L. This separation can be seen on the boxplot, normal probability plot, and histogram. From the normal plot and the box plot there appears to be roughly 12 concentrations separated from the rest of the data. Therefore tetrachlorethene concentrations in private or unknown water sources less than or equal to 17.2ug/L are most likely background concentrations.

APPENDIX G

STATISTICALLY-BASED SAMPLE SIZE CALCULATIONS FOR SOIL AND TAP WATER

Statistical Sample Size Calculations

Decision performance specifications were provided in Section 11.6.1 of the Phase II QAPP. Specifically tolerances were set for the alpha and beta error and the minimum detectable difference (delta). These specifications apply to each study area and were used as the basis for computing the number of samples needed to achieve the specified performance. Software developed for the US EPA by Pacific Northwest Laboratory was used to perform the minimum sample size calculations. The software is called Visual Sample Plan, Version 5.3.1.

For the Phase II QAPP the sample size calculations were computed when approximately 50 percent of the data were available. Most of the available were for tap water. Because of this, the calculations given in the QAPP were based on tap water data. Based on the risk evaluation in the Phase I report soil and SVOCs in tapwater pose no risk to human health. Therefore sample size calculations were computed using the decision performances specified in the Phase I QAPP to determine if enough samples have been collected.

The following assumptions were made prior to computing the required number of samples for each study area:

- Data sets do not necessarily follow a known distribution.
- Data from each study area are representative of the population within the study area. In this case, data are assumed to be collected from a representative cross-section of the population of properties within each study area. If a representative cross-section is not obtained, the required number of samples is likely to be greater than computed here.
- Data sets were compared to a RSL or background concentration.

Table 1 below presents the computed number of samples and other pertinent statistics on a chemical-by-chemical basis for soil. From this table it can be seen that the minimum sample size needed for study areas 1, 2, 3, 5, 7, 8, and 9 has been achieved. Therefore no more soil sampling is required to meet the statistical decision statements outlined in the Phase II QAPP. Additional soil samples are needed in Study Areas 4 and 6 to meet the specifications in the Phase II QAPP.

Table 2 below presents the computed number of samples and other pertinent statistics on a chemical-by-chemical basis for SVOCs in tapwater. From this table it can be seen that the minimum sample size needed for each study area has been achieved. Therefore no more SVOCs sampling in tapwater is needed to meet the statistical decision statements outlined in the Phase II QAPP.
